Anthropic Review – 5.3GW of TPUs, Fluidstack Delays, Anthropic Ahead of OpenAI Capacity, Tracking Backstops - Datacenter Model

SemiAnalysis | Reyk Knuhtsen, Kerem Kavusturucu | Monday, October 12, 2026

Conversion note: 5 images remained blank after waiting at least one minute and were omitted at the reader's request. All article text and captions are retained.

Executive Summary

Anthropic's identified footprint reaches ~4.8GW by YE2026, ~11.0GW by YE2027 and ~17.0GW by YE2028, assembled from four different kinds of capacity contract. Who signs the lease, who owns the chips and who guarantees the rent differ at every layer, so we start there, then turn to chip types and to the site-level changes this month.

- Hyperscale rent carries the near term: AWS, Google Cloud and Microsoft Azure supply 3.8GW for Anthropic by 4Q26 and 7.4GW by 4Q27. Including neoclouds, total rented capacity reaches 4.6GW and 8.7GW, respectively, none of it under a building lease in Anthropic's name. AWS is the anchor at 2.8GW by 4Q26 and 4.7GW by 4Q27 under Project Rainier, with Bedrock on top. Microsoft Azure reaches close to 1GW by 4Q27 across Virginia, Georgia, Sweden and Australia, and we suspect Microsoft's 2GW Pecos, Texas campus is being built primarily for Anthropic. Google Cloud adds TPU capacity at Google's own campuses, led by Goodnight (see below).
  - We expect Anthropic's Hyperscaler renting to keep growing fast but not accelerate. It will go down as a share of total compute, as hyperscalers are focused on higher-returns opportunities, but still want to support Anthropic, and hope Anthropic can support their custom silicon roadmap.
- Neocloud rent rapidly growing: SpaceXAI's Colossus (796MW by 4Q26, including 300MW at Colossus 2), Nscale's Monarch campus (460MW IT allocated to Anthropic), Lambda at Hut 8's Beacon Point (352MW, Nvidia-backstopped), Volta at Bitdeer's Tydal (121MW) and TensorWave at Fermi (222MW), with CoreWeave at the margin. Roughly 1.3GW by YE2027 and 2.0GW by YE2028, and the layer most exposed to clawbacks

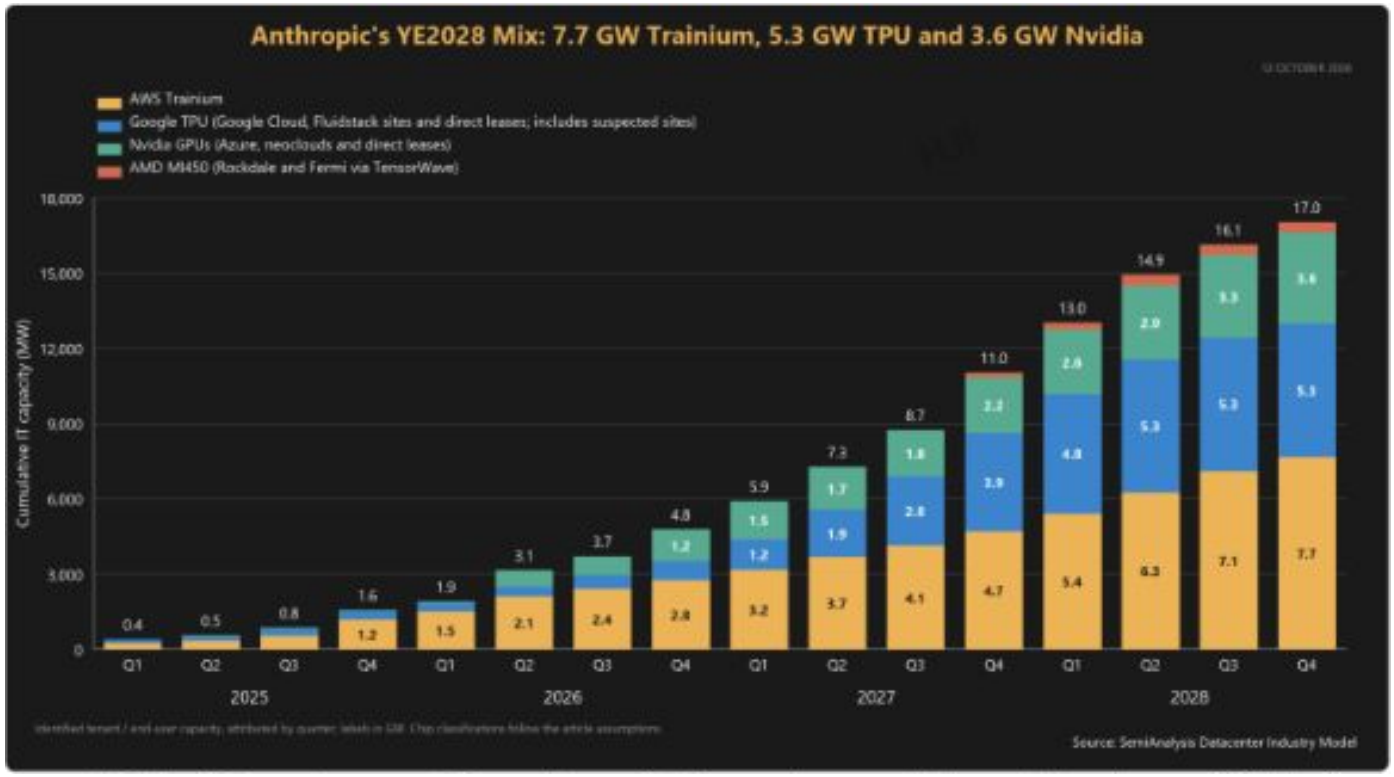

and financing conditions.

  - We expect this number to go up very fast as Anthropic signs more deals. 2028 will likely be materially higher.

- Google-backstopped Fluidstack leases: Fluidstack signs the lease, Anthropic is the end user and Google guarantees the rent. Six campuses now sit in this bucket: Lake Mariner (378MW including 42MW operating), Barber Lake (207MW), Abernathy (168MW), River Bend (245MW), Sullivan (430MW) and the new Harlingen site (500MW), ~1.9GW of IT in total, mostly delivering between 4Q26 and 2Q28.
- Direct leases in Anthropic's own name are where it is moving up the stack: Hubbard (800MW, where Google guarantees both lease and power payments and takes ~20% equity), the central Ohio commitment (245MW with an option on a further 245MW, Google-backstopped), Hawesville (401MW, wrap still expected), Rockdale (191MW build-to-suit, wrap expected) and the 360MW Zerra lease in Queensland, Anthropic's first Australian direct deal. ~2.0GW contracted, alongside the hiring and procurement groundwork for an eventual self-build.

  - We see all three major chipmakers likely to step in and backstop Anthropic, and help them with future leases too, with AMD likely as the most aggressive, as we flagged last week. We believe that AMD has a 6GW total roadmap in terms of both direct leasing and backstopping. Less than 1GW has been signed so far, leaving plenty of room to go up.

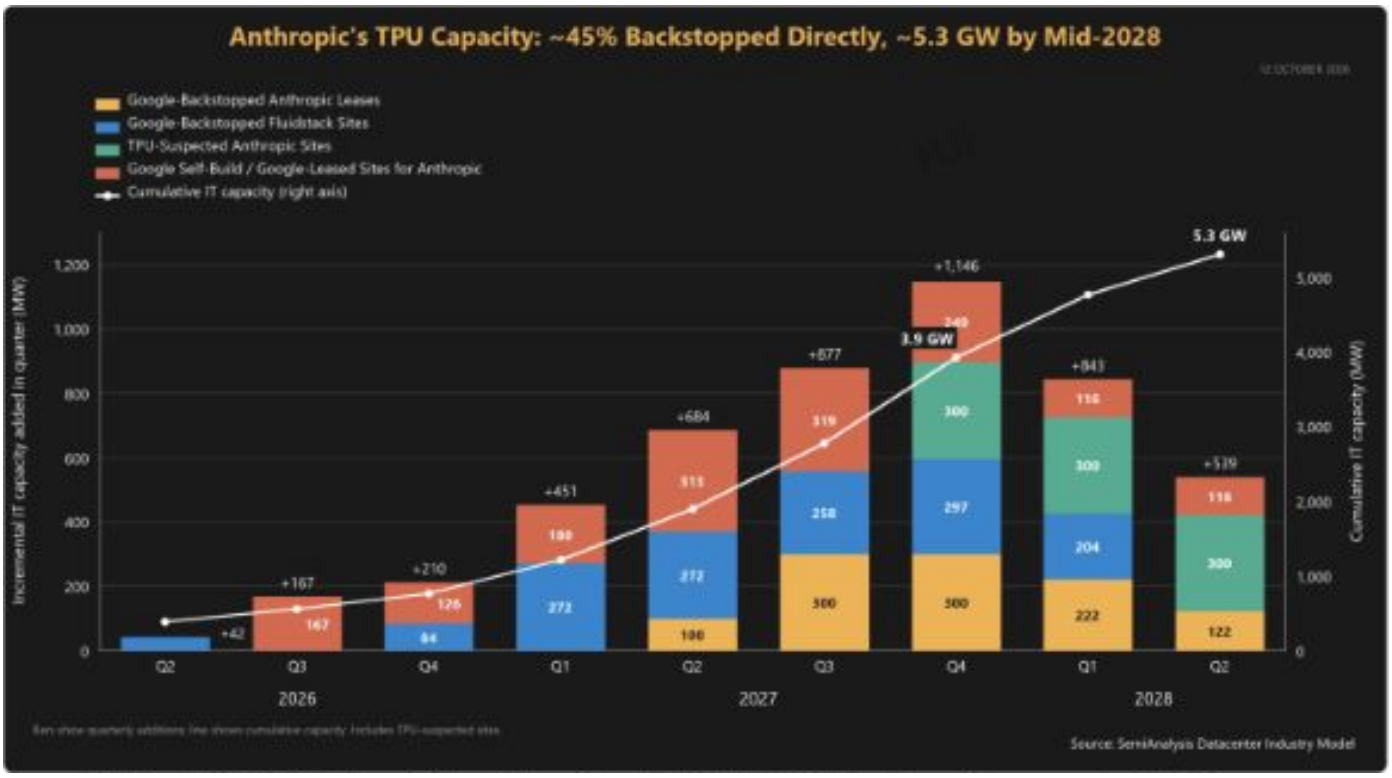

By chip, the same footprint splits into four silicon tracks:

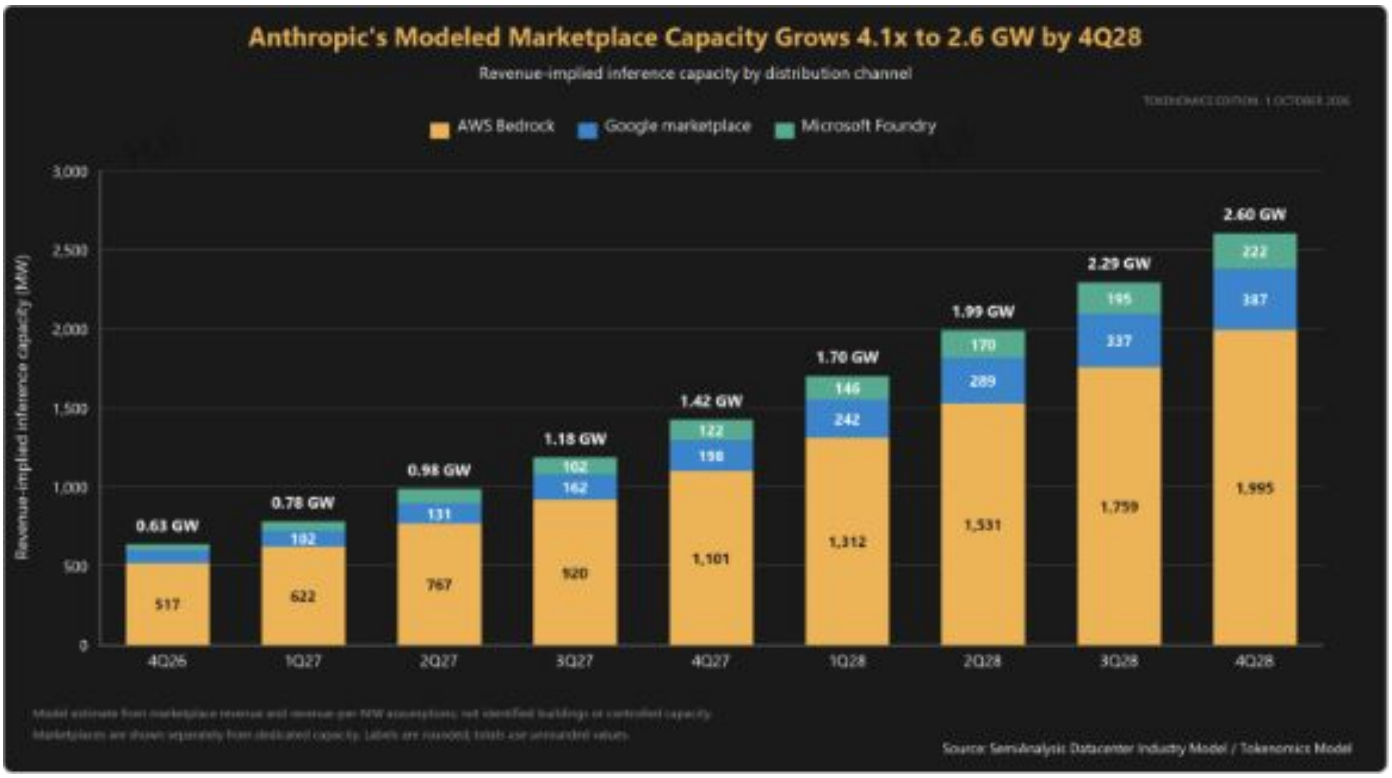

- TPUs (Google and Broadcom): Broadcom will be shipping ~6GW of TPUs for Anthropic through 2027: 1GW of Ironwood in 2026 under the October 2025 deal, bought direct as Broadcom racks ($10B + $11B orders) and likely sited at the four original Fluidstack campuses (~1.0GW IT contracted), plus 5GW of TPUv8i in 2027 per the 3QFY26 call. So far we count 5.3GW of TPU capacity online by 1H2028, ~45% of it on leases Google backstops directly, and believe the remainder will come from sites not yet leased or announced.

  - Broadcom's stated timelines most likely reflect shipment dates, not operational deployed capacity, so most of these TPUs come online ~6 months later in our model.

  - We expect TPU capacity to materially accelerate beyond this 5.3GW, BUT Anthropic and Google need to sign leases faster to avoid delays. Google in particular has slowed down a lot of deals, being too bureaucratic and hard to deal with for many operators.

- With 5.3GW identified for the initial 6GW plan through 1H28, Broadcom's incremental 10GW of TPUs for Anthropic in FY28 suggests a flood of leases coming.
  - Anthropic will need to be extremely aggressive in the leasing market, receive ongoing credit support from Google/Broadcom, as well as continue to be profitable and IPO soon for easier financing. But there's still time, given the 6mo lag we mentioned above, suggesting most of this 10GW will be delivered in H2 2028 – H1 2029.
  - It's very likely that GCP provides multiple GWs to support the 10GW endeavor.
- AWS is Anthropic's largest modeled compute supplier: our model carries 2.8GW IT by 4Q26, 4.7GW by 4Q27, 7.7GW by 4Q28 and ~12GW at full modeled build-out. We classify this AWS footprint as Trainium for the chip-mix analysis; it includes Project Rainier and other AWS-owned and leased sites across the US, Australia and India. Anthropic's April 2026 agreement targets nearly 1GW of new Trainium2 and Trainium3 capacity by YE2026 as part of an expansion of up to 5GW. We do not add that announced tranche separately to the modeled site capacity.
- Nvidia GPUs: rented rather than owned, through Azure (~1GW, with Pecos the suspected 2GW follow-on), SpaceXAI's Colossus, Nscale's Vera Rubin build at Monarch and Lambda's Nvidia-backstopped Beacon Point lease, ~2.2GW by YE2027 and ~3.3GW by YE2028 across Azure and the neoclouds.
- AMD MI450: 413MW identified, 191MW at Riot's Rockdale and 222MW via TensorWave at Fermi's Project Matador, against the up to 2GW AMD announced, but we have yet to identify the chip locations. We suspect the full 2GW should be shipped by YE2028, giving Anthropic/AMD more time for datacenter siting.
- Marketplaces are central to Anthropic's distribution: Amazon and Google marketplaces accounted for 47% of its 2025 revenue, per Reuters, giving Claude enterprise reach but adding distribution fees and dependence on hyperscaler capacity. We model marketplace inference capacity rising from 0.63GW in 4Q26 to 2.6GW in 4Q28, tracked separately from dedicated capacity.

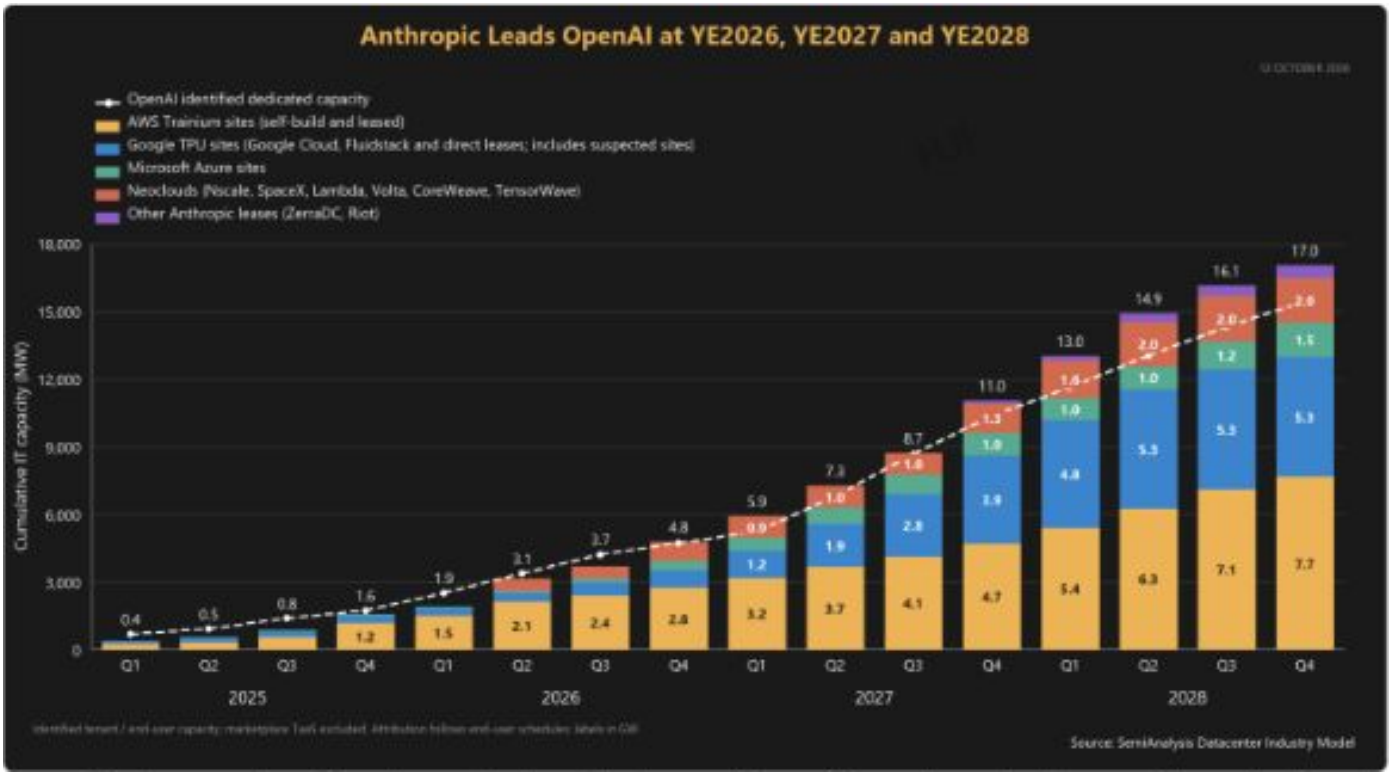

Source: SemiAnalysis Datacenter Industry Model / Tokenomics Model (1 October 2026 Tokenomics edition). Capacity inferred from marketplace revenue and revenue-per-MW assumptions.

Anthropic’s Datacenter Buildout Roars Ahead

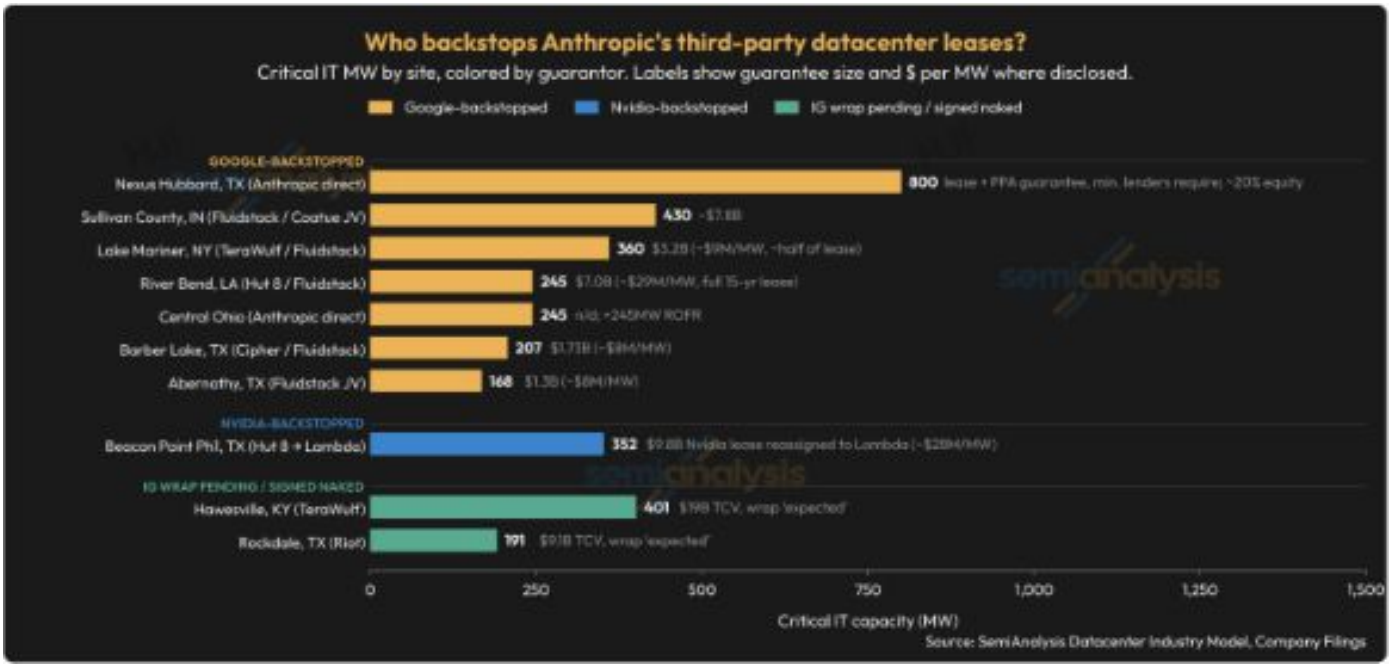

The company has picked up massively in leasing over the past few quarters, adding ~3.7GW IT of Anthropic-linked leased capacity in the two quarters ending 3Q26. Notably, they’re willing to sign 1H2028 capacity now, like the TeraWulf Kentucky site.

- Anthropic now leads OpenAI in identified dedicated capacity at YE2026, YE2027 and YE2028: the additional 300MW at Colossus 2 lifts Anthropic to ~4.77GW versus OpenAI’s ~4.71GW at YE2026, a narrow lead of ~54MW. Anthropic reaches ~11.0GW versus ~10.4GW at YE2027, a lead of ~670MW, widening to ~17.0GW versus ~15.4GW at YE2028, a lead of ~1.59GW. The 2027–28 lead is new: in every edition we published from August through 22 September, OpenAI led 2027 and 2028 by a clear margin, as much as ~3.3GW at YE2028 in our 24 August update. By YE2029 the two are effectively level at ~19.9GW each as Stargate scales. This comparison excludes marketplace TaaS agreements.

- Delivery is slipping: Lake Mariner, River Bend and Abernathy all sit ~1 quarter behind developer guidance in our model. Leases signed before chip and design are fixed are one contributor, alongside labor constraints, tenant fit-out changes, and simply aggressive timelines (9mo).
- Anthropic continues to push toward Self-building: 68 identified datacenter hires and ~30 open roles, an equipment sourcing team signing master purchase agreements for generators, switchgear and chillers, and dedicated energy and country leads. Anthropic is approaching a self-build
- In-country compute is becoming a track of its own: country leads for Canada, Japan and Korea, energy leads for Australia and EMEA working directly with grid operators and regulators, and an Australian lease negotiated at state-government level. ~1.2GW in India and ~1.0GW in Australia by 2029, mostly via AWS with Anthropic as end user, plus the 360MW Zerra lease, are the first visible results, with the Zerra DC Western Downs lease signed 16 September as Anthropic's first Australian direct deal
- Google's ~1GW Goodnight campus is a major potential source of rented TPU capacity for Anthropic: Near Amarillo, Texas, we model six buildings totaling 1,006MW, with the full campus online by 4Q2027. We suspect the campus will support Anthropic through Google Cloud, with Google owning the TPUs and Anthropic renting the compute.
- Anthropic is committing to sites before fixing chip selection and shopping lease backstops across Google, AMD and NVIDIA. That widens the supply base, with 413MW of AMD-linked capacity now identified at Rockdale and Fermi, but is one contributor to the early slips above
- New this month: Fluidstack's Cameron County campus outside Harlingen, Texas, 500MW IT for Anthropic across two buildings, sitework started in September, powered by on-site gas rather than a grid connection, with the rest of the 1,100-plus acre campus being marketed to other labs

Google Backstop Sites: Miners and Developers Building on Google's Credit

Google's backstop measures are largely focused on miners and developers, and a main reason for this is that they hold what Anthropic needs most, energized land and live interconnects, without the credit to finance a shell against a long-term lease from a private, cash-burning tenant. Google provides an investment-grade name behind the rent and their exposure is primarily taking on obligations in the case of a credit event.

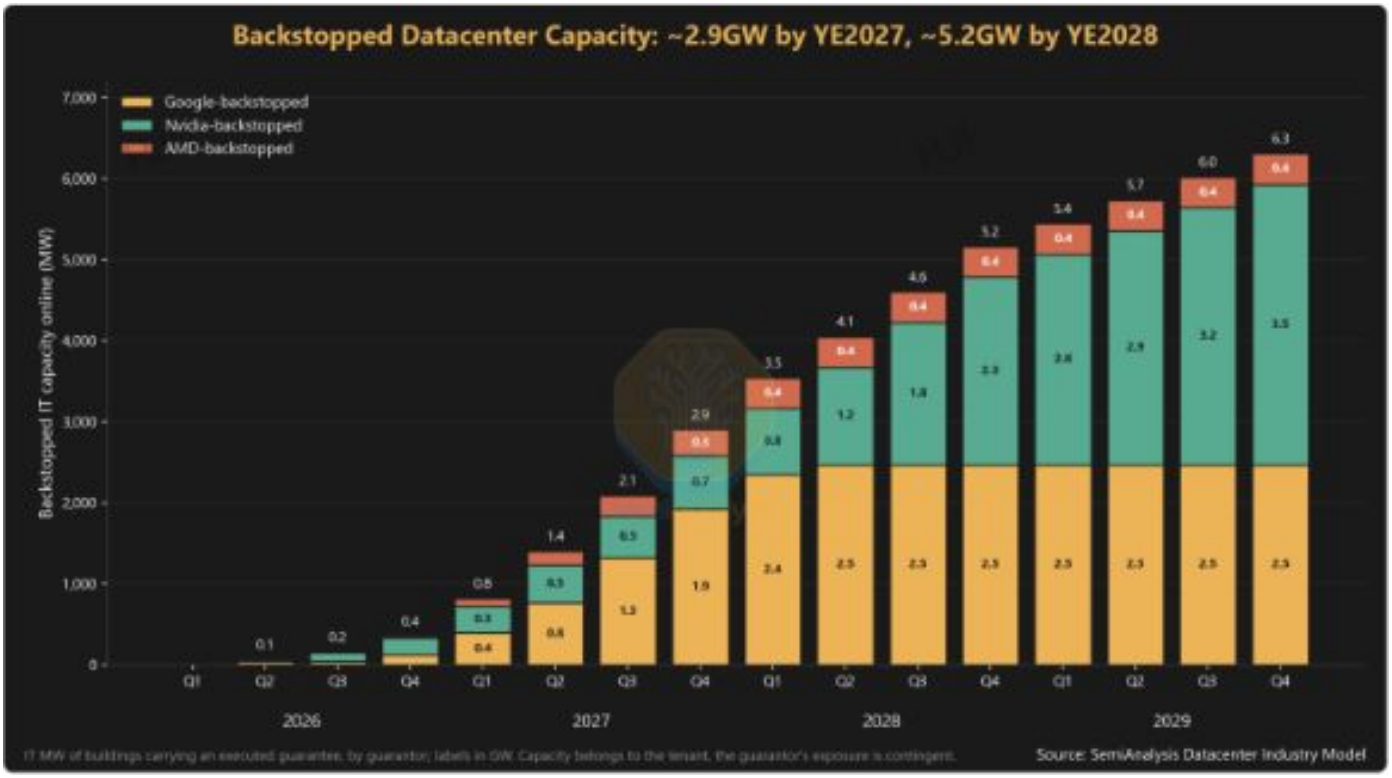

Tracking Backstops in the Datacenter Model

Every guarantee in the charts above now live in a dedicated Datacenter Backstops tab of our Datacenter Industry Model. A backstop is a guarantee a large technology company gives on someone else's datacenter obligations, and we track two forms: a lease revenue guarantee, where the guarantor pays the landlord if the tenant defaults on rent (the Fluidstack Recognition Agreements at Lake Mariner, Barber Lake, River Bend and Abernathy), and a debt backstop, where the guarantor stands behind the project's construction financing (Hubbard, central Ohio). The guarantor gets no capacity; the megawatts belong to the tenant and the exposure is contingent credit. Each backstopped building carries the guarantor, the instrument, the maximum guaranteed dollars and the execution date, with deal-level amounts spread across buildings by megawatts, and we reconcile the signed total every quarter against what Alphabet, Nvidia and AMD disclose in their own filings. Announced but unsigned wraps, such as Hawesville, Rockdale, Fermi's Matador and Bitdeer's Tydal, sit on a watch list and carry no attribution until executed.

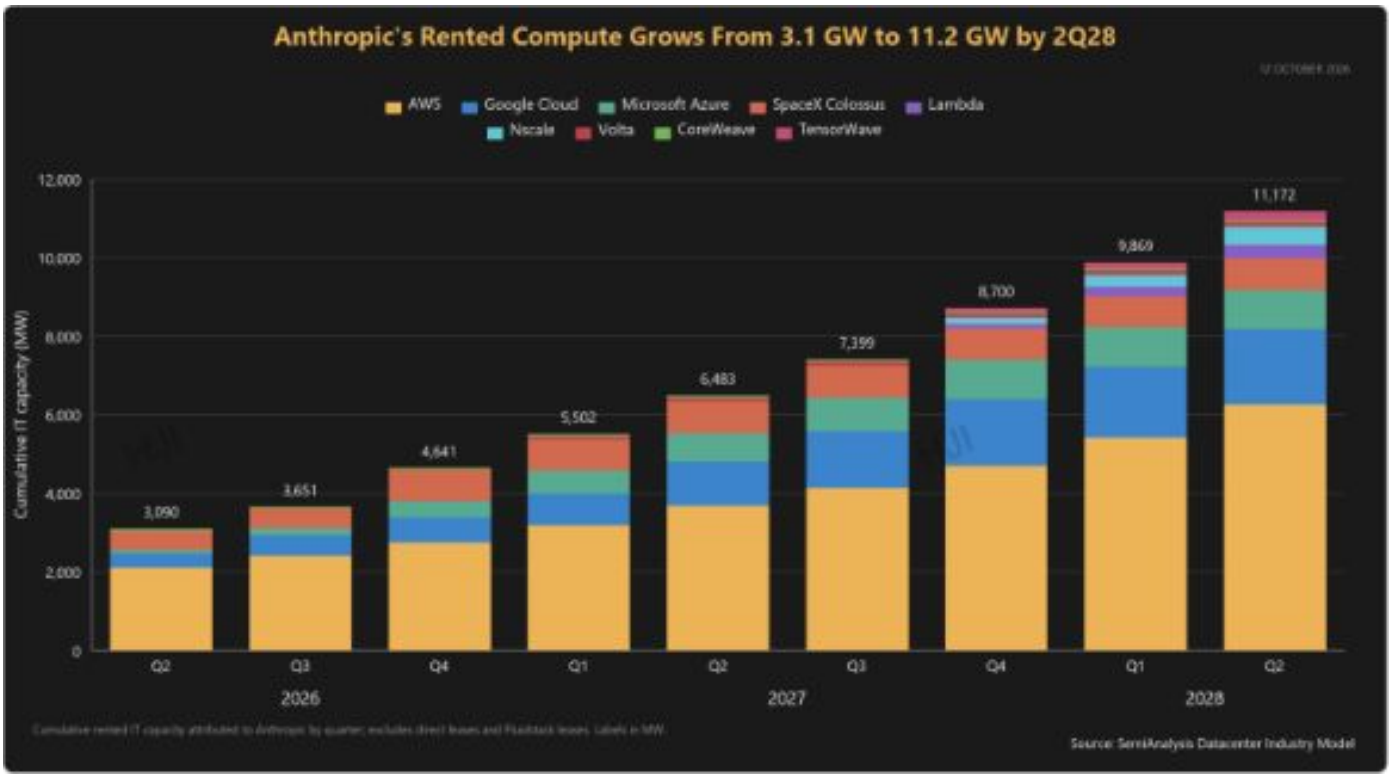

The ledger today holds ~$165B of contingent exposure across 29 buildings and ~6.3GW of IT at full build, ramping from ~2.9GW online at YE2027 to ~5.2GW at YE2028. Google's $41B is entirely behind Anthropic's compute, $28B with Anthropic as direct tenant and $13B through Fluidstack, and add Nvidia's Beacon Point

guarantee and ~$51B of the total is Anthropic-related. Nvidia's $116B is dominated by the $105B residual-value cap on OpenAI's Piketon campus, a contractual maximum rather than expected loss. The implications run both ways: for landlords, a backstop converts a private, cash-burning tenant into investment-grade rent, which is why miners and developers with energized land but thin credit dominate the list and why a wrap landing or slipping moves our delivery odds for a site. For guarantors it is a sales instrument, Google wraps TPU sites, Nvidia wraps GPU sites and AMD wraps MI450 sites, so the guarantor map is in effect a chip map, and a notional step-up in a 10-Q tends to precede the site-level disclosure by a quarter or more.

Anthropic and Rented Compute: Beyond AWS Bedrock to Azure, Colossus & Potentially Meta

Apart from the Google-backstopped leases, most of them through Fluidstack, and its own direct leases, most of Anthropic's compute comes from rented capacity: Trainium at AWS under the Project Rainier partnership, TPUs at Google's own campuses, and GPUs on Microsoft Azure. In recent months Anthropic has widened that pool to SpaceXAI's Colossus cluster and to a set of neoclouds including Nscale, Lambda, Volta and CoreWeave. And, in our Meta neocloud newsletter piece, we did talk about Meta joining the pack as well.

Here's how Anthropic's rental compute model works for them:

- Anthropic has traditionally relied on AWS when it comes to renting accelerators, and it still does. Our Datacenter Model carries 2.8 GW of AWS capacity for Anthropic by 4Q26, rising to 4.7 GW by 4Q27, 7.7 GW by 4Q28 and ~12 GW at full build-out. Anthropic expects nearly 1 GW of Trainium2 and Trainium3 online by the end of 2026, under a signed April 2026 agreement.
- Another source of rental compute for Anthropic comes from reaching customers through Bedrock, where AWS serves Claude on its own fleet for an infrastructure fee plus revenue share.
- Another major advantage for the AI lab is that the datacenter never lands on Anthropic's balance sheet. Our Datacenter Industry Model carries 4.6 GW of rented capacity for Anthropic by 4Q26, rising to 8.7 GW by 4Q27, none of it under a building lease in Anthropic's name. The original 496 MW SpaceXAI agreement across Colossus 1 and 2 allows either party to end it on 90 days' notice. We now model an additional 300 MW IT at Colossus 2 from 4Q26, taking Anthropic's total SpaceX allocation to 796 MW.

Alongside the above names, we also suspect that Microsoft's 2 GW Pecos, Texas campus is being built primarily for Anthropic. Microsoft announced the site in June 2026 together with Joulent and Chevron, whose Project Kilby gas plant is set to supply close to 2.7 GW from seven GE Vernova 7HA turbines, with first power targeted for late 2028. Our model carries the campus at 2 GW with operations starting mid-2028. We have not confirmed the tenant, but our checks indicate that the size and timing fit Anthropic's Azure commitment. As with Anthropic's existing Azure footprint, Microsoft would own the buildings and the accelerators, but Pecos would be a single dedicated cluster rather than capacity spread across regions.

Source: SemiAnalysis Datacenter Industry Model; Microsoft, Pecos, Texas, United States, October 6, 2026.

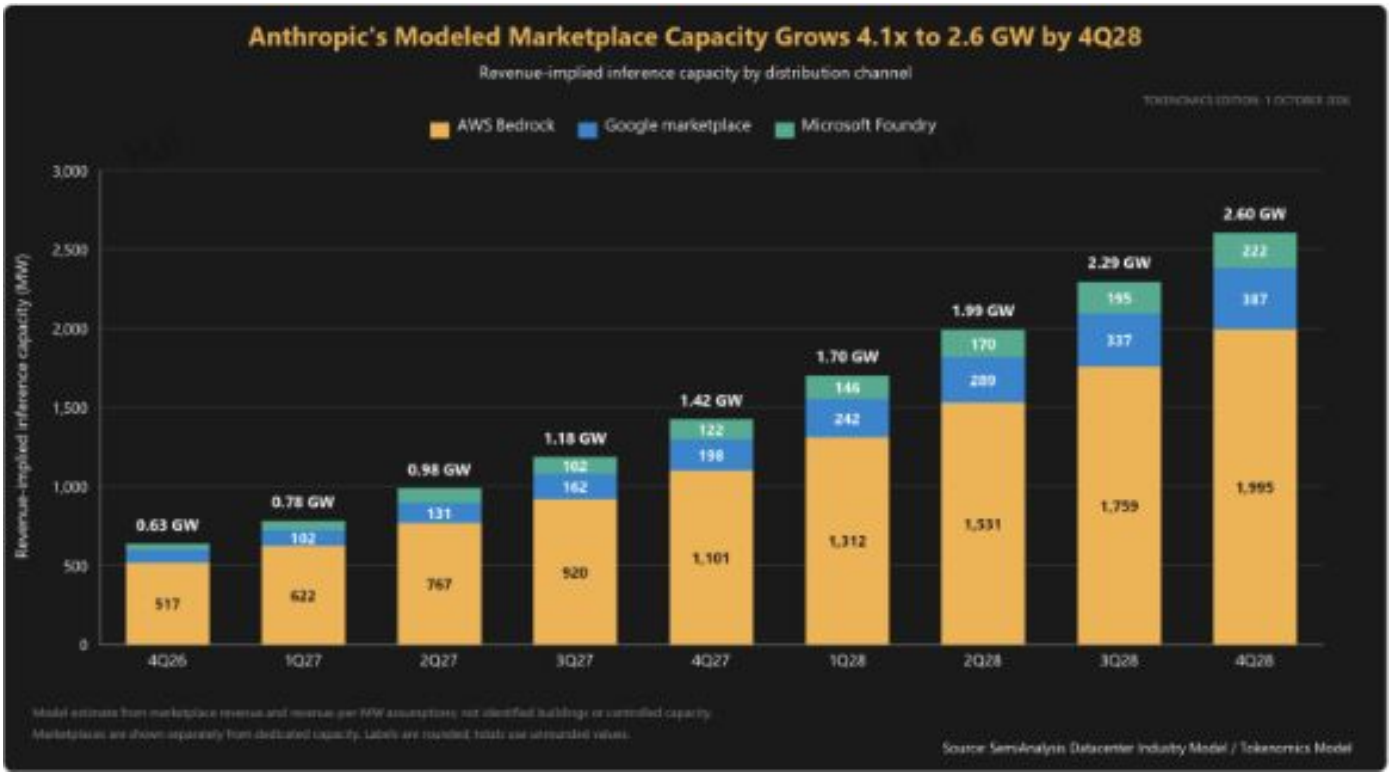

Meta is the one prospective counterparty still without a signature. In our July piece on Meta compute we flagged that Meta was in final talks with Anthropic for private instances of Claude, a Bedrock-style arrangement, and that we expected a SpaceX-type deal of around $10 billion to start Meta's cloud flywheel. The New York Times has

since reported the same talks.

Meta materializing this model may be held back for now, given that Meta Superintelligence Labs has regained traction with the Muse family, from Muse Spark in April through Muse Image in July and the Muse Code agent in August. That fits the framing of our July piece: MSL remains the core engine for Meta's compute, and selling capacity to Anthropic was always the option Meta would exercise selectively, with a 90-day clawback if its own models needed the GPUs back.

Marketplace Compute: Scaling Claude Through Cloud Distribution

Anthropic's inference demand also extends to Claude sold through hyperscaler marketplaces. Our Tokenomics forecast, using the 1 October 2026 edition, implies approximately 0.63GW of capacity supporting these channels in 4Q26: 517MW on AWS Bedrock, 81MW on Google's marketplace platform and 34MW on Microsoft Foundry. The forecast rises to approximately 2.6GW by 4Q28: 1,995MW on AWS Bedrock, 387MW on Google's marketplace platform and 222MW on Microsoft Foundry.

Source: SemiAnalysis Datacenter Industry Model / Tokenomics Model (1 October 2026 Tokenomics edition). Capacity inferred from marketplace revenue and revenue-per-MW assumptions.

We estimate this indirect capacity using marketplace revenue and revenue-per-inference-MW assumptions, separately from Anthropic's dedicated leases and cloud rentals. These estimates represent infrastructure supporting marketplace demand; they do not establish additional capacity contractually controlled by Anthropic or identify individual buildings. Marketplace billing also does not uniquely identify the hosting arrangement: Anthropic distinguishes partner-operated platforms from Anthropic-operated services billed through cloud marketplaces. We therefore keep these estimates separate and do not mechanically add them to our dedicated-capacity totals without reconciling potential overlap.

These marketplaces also provide distribution into enterprises purchasing through their existing cloud relationships. Reuters reported on 29 September 2026, based on Anthropic's confidential IPO prospectus, that Amazon's and Google's marketplaces accounted for approximately $2.16 billion, or 47%, of Anthropic's 2025 revenue. Reuters estimated that Anthropic paid $351 million in distribution fees, approximately 16 cents per marketplace revenue dollar. Distribution fees are distinct from underlying compute costs, so that percentage does not represent the full cost of serving marketplace customers. Marketplace distribution therefore gives

Anthropic another route to scale Claude's availability and reach, while leaving it exposed to both compute costs and distribution fees.

Marketplace capacity also depends on where compute is available. AWS's cross-region inference routes requests across eligible regions to help meet demand, but Bedrock still has usage quotas and can face temporary capacity constraints. Data residency requirements can further restrict the regions where requests may be processed. Marketplaces can help meet growing demand for Claude while Anthropic's dedicated campuses come online, subject to capacity being available in permitted regions. Anthropic's expansion into individual countries and the delivery timelines of its dedicated sites therefore remain important, even as marketplace demand grows.

Naked Leases and Small Bites – How Anthropic Is Assembling Gigawatts

Signing before the deployment is fully specified

Our Datacloud Austin reporting describes Anthropic signing "naked" leases with no design in mind and likely no chip selected so AMD, Nvidia, and Google could compete to backstop the leases and supply the chips. Anthropic is accepting a mismatch between the timing of its project commitments and the final deployment design to secure XPU delivery and better financing terms.

The strategic risk is that early leasing secures a place in the construction pipeline without securing the original completion date. Signing the lease therefore does not mean the design, hardware, and delivery schedule are set in stone, though this doesn't mean that every agreement doesn't have a plan.

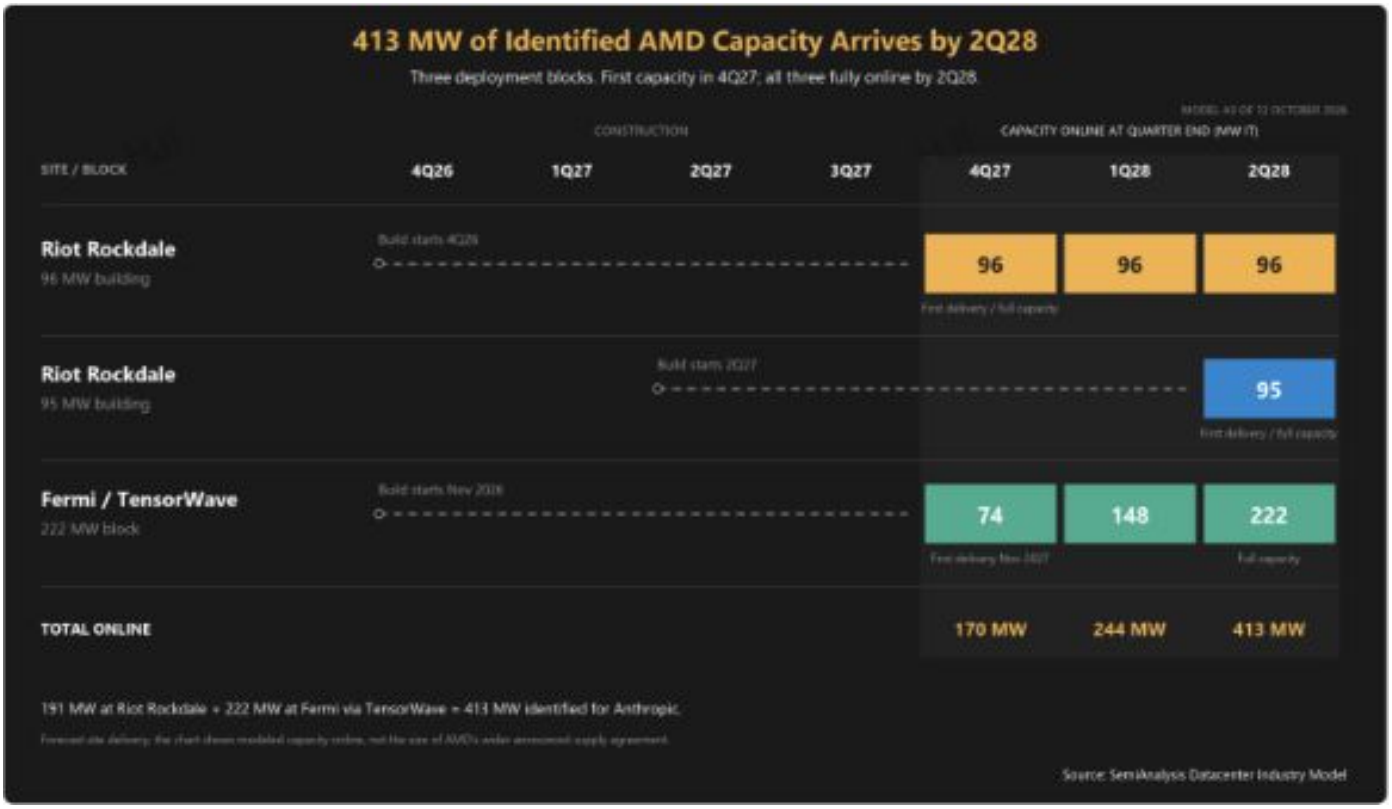

Large commitments assembled through smaller deliveries

Anthropic already has multi GW procurement programs. Its Amazon agreement covers up to 5GW of new capacity, while Broadcom's 3QFY2026 call puts the 2027 TPU tranche at 5GW. AMD subsequently announced up to 2GW of MI450-series systems, with deployment of the first GW beginning in H1 2027. These announcements describe different parts of the supply chain and different delivery periods.

The individual site deals cover smaller amounts of capacity, notably different from OpenAI's leasing of multi-GW campuses, like the 8GW SB Energy site or the Camellia 2.7GW site. TeraWulf has signed 401MW IT directly with Anthropic at Hawesville. Riot has contracted 191MW IT which we suspect to be with Anthropic. Bitdeer's Tydal agreement covers 121MW IT leased to Volta, with Anthropic reported as the downstream compute buyer. These are respectively a direct facility lease, a build to suit lease and a two-layer colocation and compute arrangement.

We previously covered Nscale's Monarch campus at Point Pleasant in our August neocloud note. Nscale advertises a 1.35GW first phase using NVIDIA Vera Rubin systems, with delivery targeted by early 2028 with its long term ambition passing 8GW of potential power capacity. Our research allocates 460MW IT at Monarch to Anthropic. Our current model places Anthropic's first delivery in Q4 2027, with approximately 153MW available that quarter, 307MW in Q1 2028, and the full 460MW in Q2 2028, following a construction start in November 2026. This moves our initial delivery forecast back slightly from September 2027.

AMD Delivery Timelines

Our identified AMD linked Anthropic inventory totals 413MW of IT capacity across Riot's Rockdale campus and the TensorWave block at Fermi Panhandle.

At Fermi's Project Matador in the Texas Panhandle, we expect the 222 MW we attribute to Anthropic to start construction in November 2026; delivery starts in November 2027 and runs through Q2 2028. Closing of its publicly disclosed lease with TensorWave remains subject to financing and guaranty conditions; its closing date was recently extended by ~1 month to October 31, 2026. The recent TCEQ pause Governor Abbott has imposed does not affect this project as 5.1GW has already been issued in February 2026.

Anthropic & Hiring Trends – One Step Closer Towards Self-Build

Anthropic's hiring cycle has given us credible evidence that the company is building the datacenter organization that a self-build would need. Our research spans 68 people in datacenter and compute roles we can identify at the company, most of them hired since January 2026, along with about 30 related postings that are still open.

Design and Delivery Authority: Running the Inside of Leased Buildings

Anthropic's design team is the core 'engine' behind the company's leases, and it basically writes the reference designs and specifications its build partners work against and reviews their engineering submittals. The team is led by a Design Lead who previously worked as a Google TPU and GPU datacenter system architect, and its design and delivery hires include people from developers such as STACK and Compass.

- Anthropic has taken up the entire datacenter engineering ladder with its spree of job postings, covering civil, structural and architectural design, electrical, mechanical and controls. One example is a CSA architect opening for a "technical owner for the physical building fabric," with a remit running from the earliest site feasibility studies through construction delivery.
- While this shows that Anthropic already controls a large part of the design and engineering layer inside its leased buildings, layering up the design teams in this way is another indication that an eventual shift to self-build won't require the AI lab to stand up a design and delivery organization from scratch.

Data Center Architect, CSA

Remote-Friendly, United States

We are looking for a Principal Data Center Architect with deep expertise in Civil, Structural, and Architectural (CSA) design to join our growing infrastructure team. This role is the technical owner for the physical building fabric of Anthropic's AI compute facilities — from the earliest site feasibility studies and test fits through reference design development, design partner oversight, and construction delivery.

As Anthropic scales its data center program across multiple sites in the United States and internationally, you will set the civil, structural, and architectural standards that govern how our facilities are designed and built. You will work directly with design-build partners, AE firms, and internal mechanical, electrical, and IT infrastructure teams to ensure our facilities are optimized for high-density AI workloads, constructable on aggressive timelines, and replicable across a growing portfolio.

This is an owner's engineer role — you are the technical authority, not a consultant. You will be expected to make binding design decisions, identify problems before they reach the field, and drive standardization across a pipeline of concurrent projects globally.

Source: Anthropic Careers

Equipment Ownership: The Clearest Self-Build Tell

Our tracking of Anthropic's staffing patterns indicates that the AI lab is now investing heavily towards DC equipment roles, and specifically towards owning the power and cooling plant inside the buildings it leases. This is a team that has started to build this year, and several hires are from Meta's AI and datacenter infrastructure sourcing groups. Anthropic is still hiring all the way from Head of Compute Supply Chain down to factory-floor quality engineers.

- One role in particular stands out, as Anthropic's Data Center OFE Strategic Sourcing Manager is tasked with driving Master Purchase Agreements (MPAs) with OEMs for the long-lead equipment a datacenter depends on. The list runs to "generators, medium- and low-voltage switchgear, transformers, UPS systems, chillers, cooling towers, CRAHs, and pumps," and it comes backed by a "global inventory strategy including warehousing, third-party logistics, buffer stock."
- In a conventional lease, the landlord procures this plant and recovers it through rent; here, the tenant buys it, holds it in inventory, and drops it into whichever site is ready. This lets Anthropic take responsibility for the most critical delivery path, the equipment itself, and staffing these teams now means that when self-build ambitions materialize, Anthropic will already have its supply chain mapped out.

- Staffing a sourcing department isn't a new feat for AI labs, and OpenAI's industrial compute group carries similar roles, but Anthropic's version is built for autonomy from both landlord and vendor. Its sourcing leads sign the equipment agreements directly, its quality engineers sit "inside our OEMs' and integrators' factories" witnessing acceptance tests before gear ships, and its manufacturing engineers own how its own racks are built at contract manufacturers.

Data Center OFE Strategic Sourcing Manager

Remote-Friendly (Travel-Required) | San Francisco, CA | New York City, NY

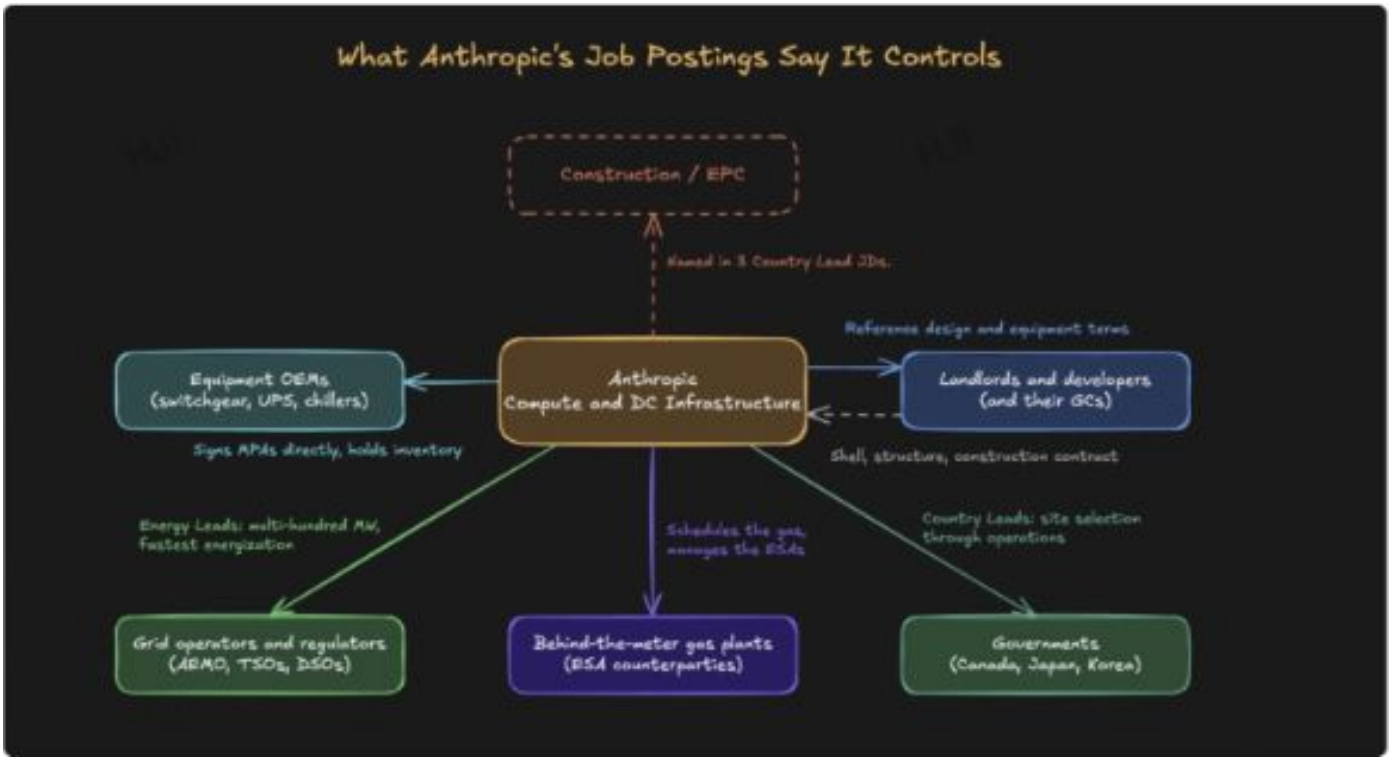

Drive commercial negotiations and Master Purchase Agreements for critical electrical and mechanical infrastructure such as generators, medium- and low-voltage switchgear, transformers, UPS systems, chillers, cooling towers, CRAHs, and pumps.
Audit partner procurement schedules, ensure optimal allocation, and drive cost efficiency of supply in constrained markets.
Implement frameworks for ensuring third-party data center partners and general contractors adhere to commercial equipment terms and technical specifications.

Source: Anthropic Careers

Anthropic's Energy, Land, and Country Teams – Push Towards Moving the Ownership Layer

Usually, the responsibility of sourcing energy has rested with the developer, but in Anthropic's case, the dynamics look to shift. The company's energy leads for Australia and EMEA were posted to secure multi-hundred megawatt blocks of capacity through grid-connected and behind-the-meter routes, working directly with grid operators and regulators and structuring the power purchase and network agreements themselves.

- The Energy Scheduling & Portfolio Lead goes a step further, owning energy availability across the datacenters Anthropic takes on directly rather than renting through cloud providers, scheduling the gas for the behind-the-meter plants that serve its sites, managing the plant operators' performance, and building the processes to "ultimately support asset management across our energy portfolio."
- In the regions, the Compute Country Leads for Canada, Japan and Korea are each cast as the "single, accountable owner" of Anthropic's compute in that country, and the Canada posting prefers a Canadian national with established links into government and the energy industry. Site selection, power and government relations are responsibilities that usually sit with a developer, and Anthropic is now taking them into its own hands.

Source: SemiAnalysis Datacenter Industry Model

Anthropic Site Checks

The Google Backstopped Datacenters

One of the biggest backstop measures that we model is the Nexus Data Centers campus at Hubbard, Texas, where four Anthropic blocks of 200 MW each carry a Google guarantee, with Anthropic as the direct tenant and chip owner. The first 100 MW lands in 2Q27 and the full 800 MW is online by 1Q28, all of it behind the meter. Hubbard is also an outlier in our list, as Google guarantees both the lease and the power payments once construction completes, and takes about 20 percent of the project rather than warrants. Anthropic is also a ‘direct’ tenant here, unlike other sites where Fluidstack is involved in the loop.

Source: SemiAnalysis Datacenter Industry Model; Nexus Data Centers, Hubbard, Texas, United States, September 2026.

Fluidstack/NextFrontier's JV campus at Sullivan, Indiana is another major Google backstop measure, and we model it as two Anthropic blocks through Fluidstack, 245 MW and 185 MW. The first megawatts land 3Q27, with the full 430 MW online by 1Q28. The backstop here sits one layer up from the miner sites: the two buildings belong to Meridian Arc, a joint venture between Fluidstack and Next Frontier, a Coatue-affiliated vehicle, per Latham & Watkins, which advised Next Frontier on the $5.7 billion notes offering that funded the land and both buildings.

Source: SemiAnalysis Datacenter Industry Model; Fluidstack, Sullivan, Indiana, United States, September 16, 2026.

TeraWulf's Lake Mariner campus in Barker, New York, was one of the first Google-backed leases in the market and is already producing megawatts. We model three Anthropic blocks through Fluidstack: 42 MW operating and two 168 MW blocks under construction. Electrical labor constraints and ongoing changes to the customer's electrical, cooling and operational requirements have delayed the buildout. We are therefore pushing our delivery estimates back by one quarter, with the two new blocks now expected to begin delivering capacity in 1Q27 and 2Q27, respectively. This shifts Anthropic's modeled ramp to 294 MW by 2Q27 and the full 378 MW by 3Q27.

Source: SemiAnalysis Datacenter Industry Model; TeraWulf, Lake Mariner, Barker, New York, United States, July 23, 2026.

Hut 8's River Bend campus at St. Francisville, Louisiana is modeled as four Anthropic blocks via Fluidstack, two of 60 MW and one of 65 MW landing in 3Q27 and a final 60 MW in 4Q27. Hut 8 has guided to a first data hall in 2Q27, but we see 3Q27, a quarter later, based on construction pace, with 215 MW online by 4Q27 and the full 245 MW by 1Q28.

River Bend is the only site where the landlord has put Anthropic's name on paper: Hut 8's December 2025 release described a partnership with Anthropic and Fluidstack for at least 245 MW, and its 8-K describes the guarantee plainly as 'a financial backstop provided by Google LLC for all rent and certain other financial obligations under the lease agreement.

Source: SemiAnalysis Datacenter Industry Model; Hut 8 River Bend, Louisiana, United States, August 22, 2026.

Cipher's Barber Lake campus at Colorado City, Texas is the backstop measure closest to delivery. We view it as two Anthropic blocks through Fluidstack, 168 MW from 4Q26 and 39 MW from 1Q27, 207 MW of IT on 300 MW of gross capacity, reaching full capacity by 2Q27. Cipher's 8-K describes a Recognition Agreement among Cipher, Fluidstack and Google under which Google backstops Fluidstack's lease obligations.

Cipher reported the tenant already in beneficial use of the building in August 2026, and on 14 September Cipher, Fluidstack and Anthropic jointly pledged $10 million to the town's water system, the first time Cipher has put Anthropic's name beside the site.

Source: SemiAnalysis Datacenter Industry Model; Cipher, Barber Lake, Texas, United States, August 19, 2026.

Fluidstack’s Abernathy campus in Hale County, Texas is the smallest of the backstop sites. Our DCM carries 168 MW of IT, with the first 84 MW landing in 1Q27 and the full 168 MW online by 2Q27.

The project began as a TeraWulf and Fluidstack joint venture in October 2025 with a 25-year hosting commitment, and Google backstops roughly $1.3 billion of Fluidstack’s obligations under a Recognition Agreement in the same form used at Lake Mariner and Barber Lake. The land belongs to Aligned Data Centers under a ground lease, and in July 2026 TeraWulf sold its 50.1 percent to a Fluidstack-led investor group.

Source: SemiAnalysis Datacenter Industry Model; Fluidstack, Abernathy, Texas, United States, September 11, 2026.

We are also aware of another 245 MW commitment by Anthropic with a leading developer in central Ohio, structured as a direct lease with a Google backstop and carrying an option on a further 245 MW.

Fluidstack’s Cameron County campus outside Harlingen, Texas is the newest site in our TPU inventory. We model 500 MW of IT for Anthropic, with construction starting 4Q26, the first 167 MW delivering in 4Q27 and the full 500 MW online by 2Q28. Cameron County issued the site-work permit on September 10, with satellite imagery showing the first graded pad appearing between August 28 and September 12. We expect the campus to be powered by on-site gas generation, which we model as Siemens industrial gas turbines, rather than relying on a grid connection: AEP Texas is the local utility, but the ~9.5 GW of signed Cameron County large load sits behind AEP’s proposed $4.9 billion Rio Grande Valley 765 kV build-out, which is not due in service until 2031. We believe Anthropic has taken two buildings, with Fluidstack marketing the remainder of the 1,100-plus acre campus to other labs.

North America

United States

CIPHER MINING BLACK PEARL

216MW of contracted IT capacity is targeted for full delivery by Q4 2027 at Cipher's Black Pearl site in Wink, Texas, all of it leased to AWS under a 15-year agreement across two 108MW buildings with Anthropic being the end user. The first building is under construction, with operations starting in September 2026 and full capacity by year-end. The second broke ground in mid-2026 and targets operations in Q3 2027 and full capacity by Q4 2027. Refer to The Cryptominers Bible for further information on this and the other miner sites in this note.

Source: SemiAnalysis Datacenter Industry Model; Cipher Digital, Wink, Texas, United States, October 1, 2026.

CIPHER MINING STINGRAY

70MW of contracted IT capacity is targeted for delivery in Q3 2027 at Cipher's Stingray site in Texas, all of it leased to AWS in a single building with Anthropic being the end user. Earthwork and substation work began in the first half of 2026, with grid energization targeted for Q4 2026 through an Oncor facility extension and operations starting September 2027. The site holds conditional ERCOT approval for 100MW, and Cipher has submitted a further expansion as a studied load in ERCOT's Batch Zero process, which we carry as untenanted with operations from 2030. Refer to The Cryptominers Bible for further information on this and the other miner sites in this note.

Source: Cipher Digital Investor Presentation

Riot Platforms Rockdale

241MW of contracted IT capacity is targeted for full delivery by Q2 2028 at Riot's Rockdale, Texas site, comprising 50MW for AMD and 191MW for a frontier AI tenant. AMD's initial 25MW is delivered, with the full 50MW due by Q2 2027; the second tenant's deployment targets 96MW in Q4 2027 and the remaining 95MW by Q2 2028. The campus has 700MW of developed power capacity and continues Bitcoin mining, with the second tenant reportedly Anthropic, though this is not yet confirmed by Riot. Refer to The Cryptominers Bible for further information on this and the other miner sites in this note.

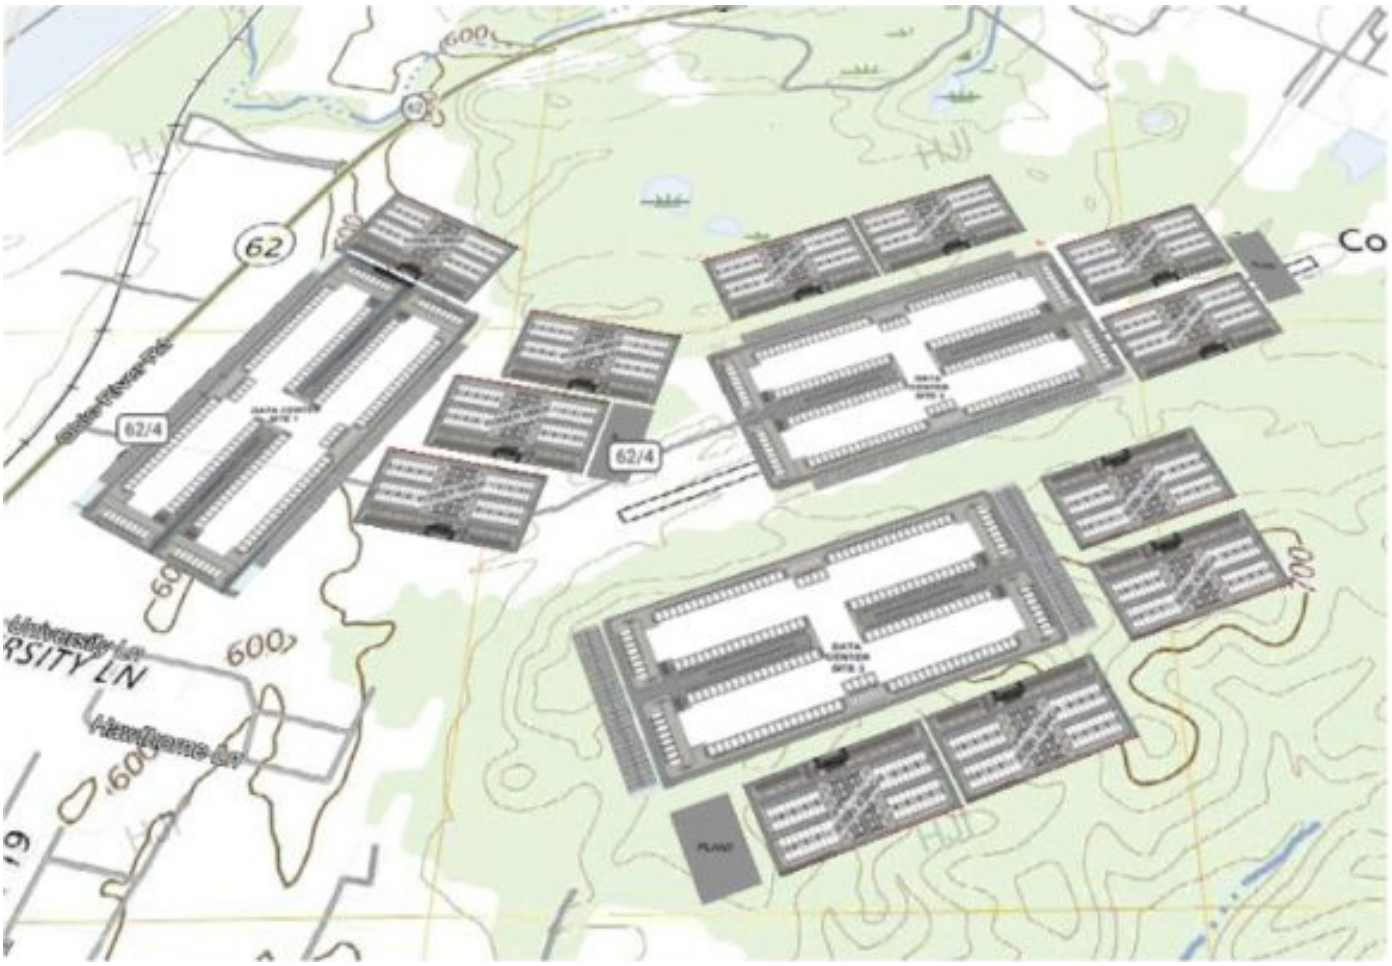

Source: SemiAnalysis Datacenter Industry Model; Riot Platforms, Rockdale, Texas, United States, August 20, 2026.

Nscale Point Pleasant

Nscale's Point Pleasant plans to deliver 1.35GW of IT capacity across three buildings, with Phase 1 completion targeted for Q1 2028 and longer-term expansion potential exceeding 8GW of power capacity. The initial phase is designed around 2.16GW of on-site generation using 864 Caterpillar gas engines, operating independently of the public electricity grid. Permitting has progressed: WVDEP has published a draft PSD permit R14-0042 and a favorable preliminary determination, with public comments due October 30, 2026. This is a positive permitting milestone, but final approval remains outstanding. We retain our modeled Anthropic delivery ramp from Q4 2027 through Q2 2028.

Source: SemiAnalysis Datacenter Industry Model; Nscale, Point Pleasant, West Virginia, United States, September 2, 2026.

Source: West Virginia State Filings, Building Plans

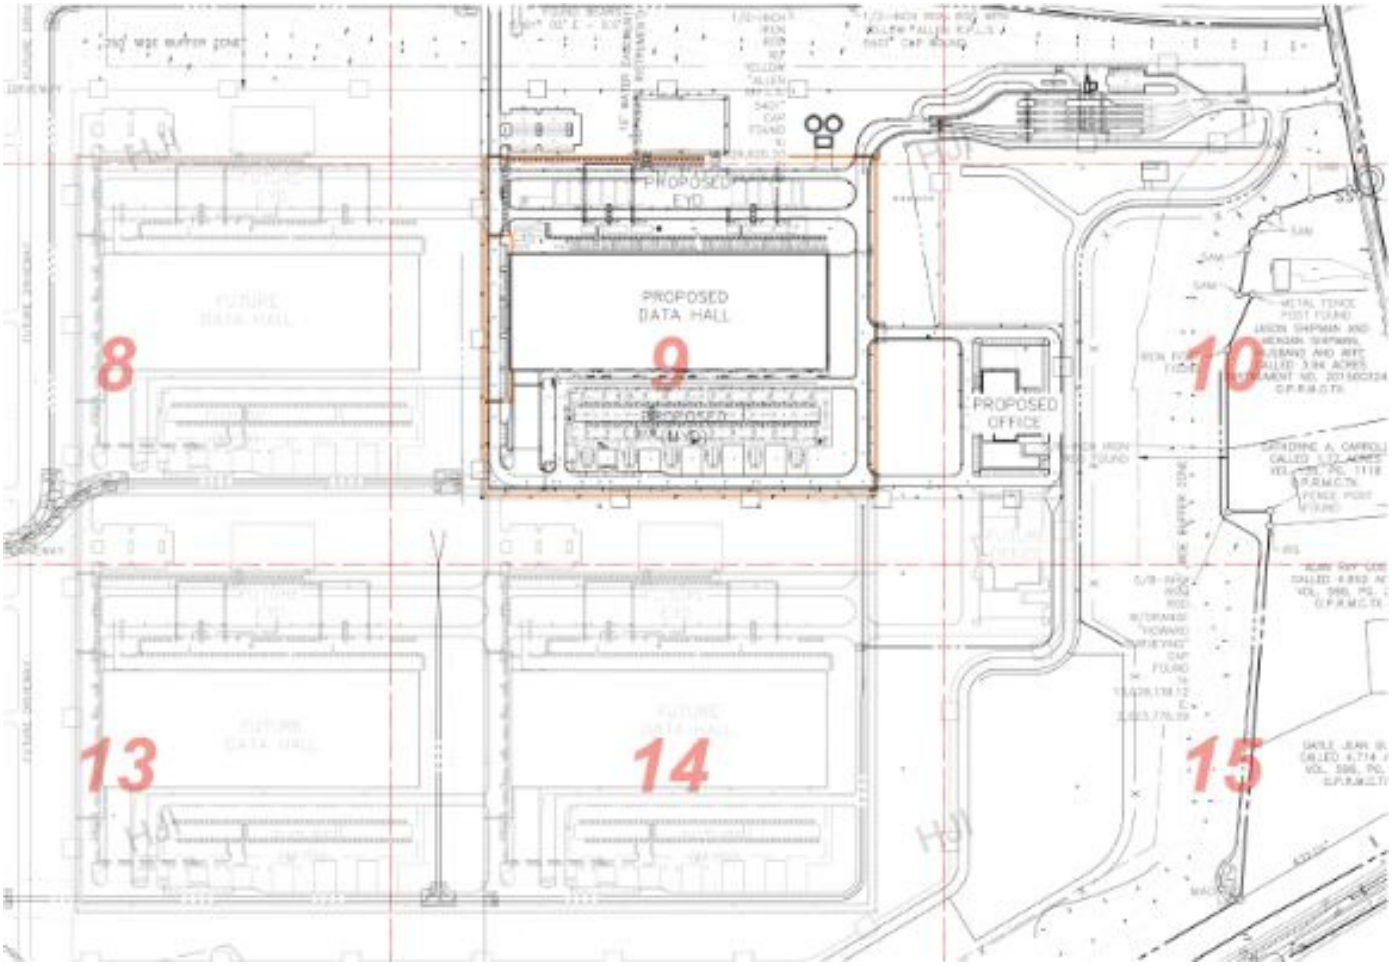

Rowan Digital Infrastructure Natalia

300MW across a 440 acre site is planned at Rowan's campus near Natalia, Texas, with an initial 87MW hall expected in 2027. We expect facility delivery in Q2 2027, compared with Quinbrook's late 2026 target for Cinco 1 and Rowan's campus completion target of 2027. Google is listed as the registered operator, Rowan as owner and Design LLC as occupant though we believe Anthropic to be the end user. The county site plan shows one proposed data hall and three future halls.

At Natalia/Cinco, Google is the tenant and Anthropic is the end user. We forecast initial facility delivery in Q2 2027, versus Quinbrook's earlier late 2026 target; Rowan's project page now lists completion in 2027. We model the first 87MW hall reaching full capacity by Q1 2028, with the 261MW Anthropic block delivering from Q4 2027 and fully online by Q2 2028.

Source: SemiAnalysis Datacenter Industry Model; Rowan Digital Infrastructure, Natalia, Texas, United States, September 2, 2026.

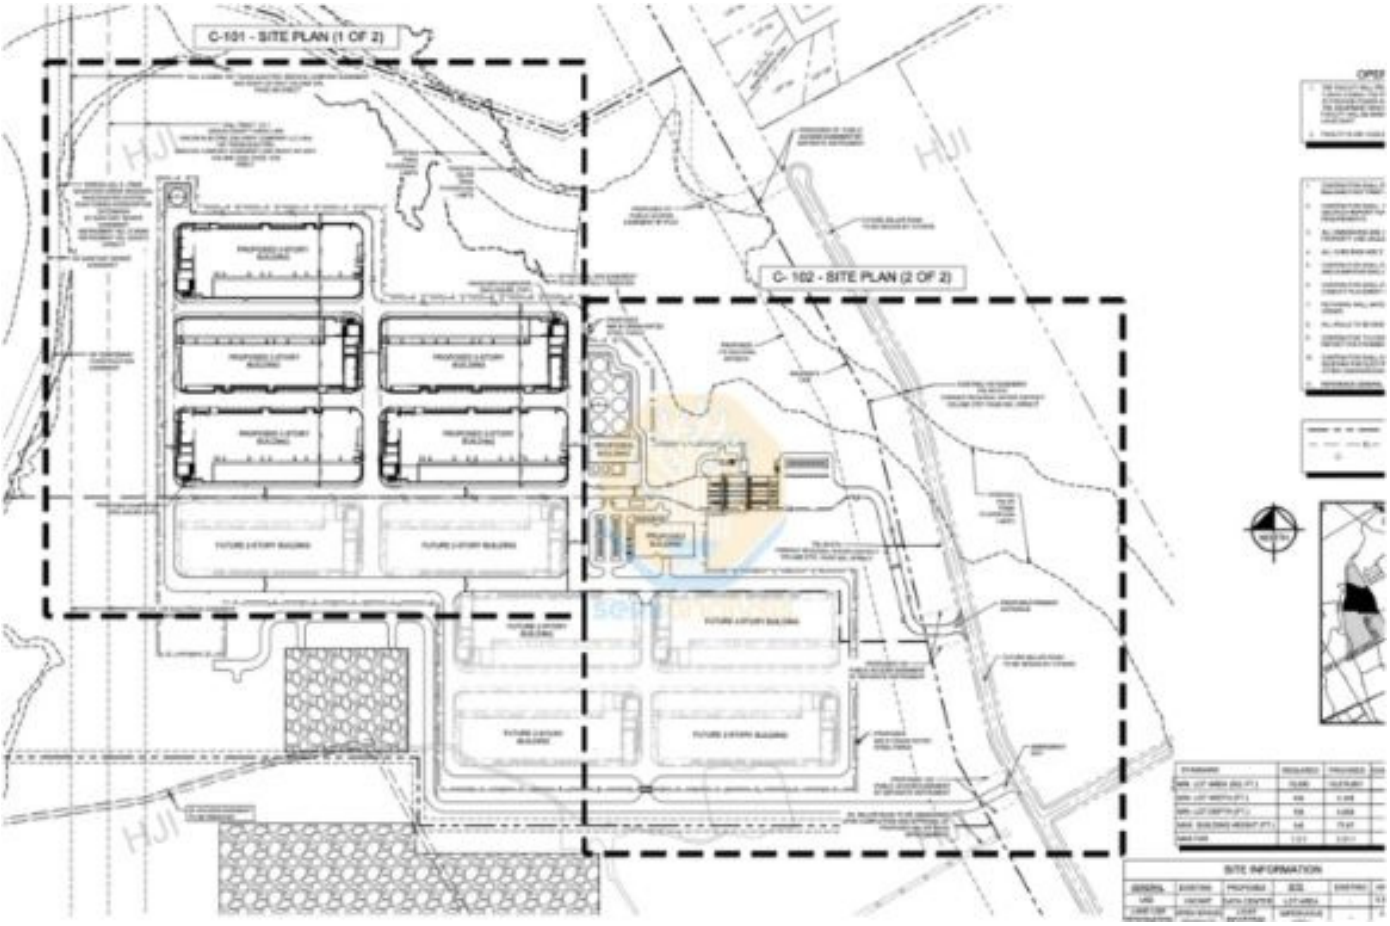

Source: Texas State Filings, Building Plans

AWS Grand Prairie 2

The 810-acre PowerHouse/Provident Grand Prairie campus is marketed for up to 1.8GW of utility power across four phases, with an initial 500MW approved by ERCOT. We expect initial delivery in Q4 2027, behind PowerHouse's advertised Q1 2027 target. Building 1's state filing targets completion in Q2 2028, while broader campus development extends through 2029 and beyond. Building foundation work is documented in city records from July 2026 and is visible in September satellite imagery.

Source: SemiAnalysis Datacenter Industry Model; AWS, Grand Prairie 2, Texas, United States, September 7, 2026.

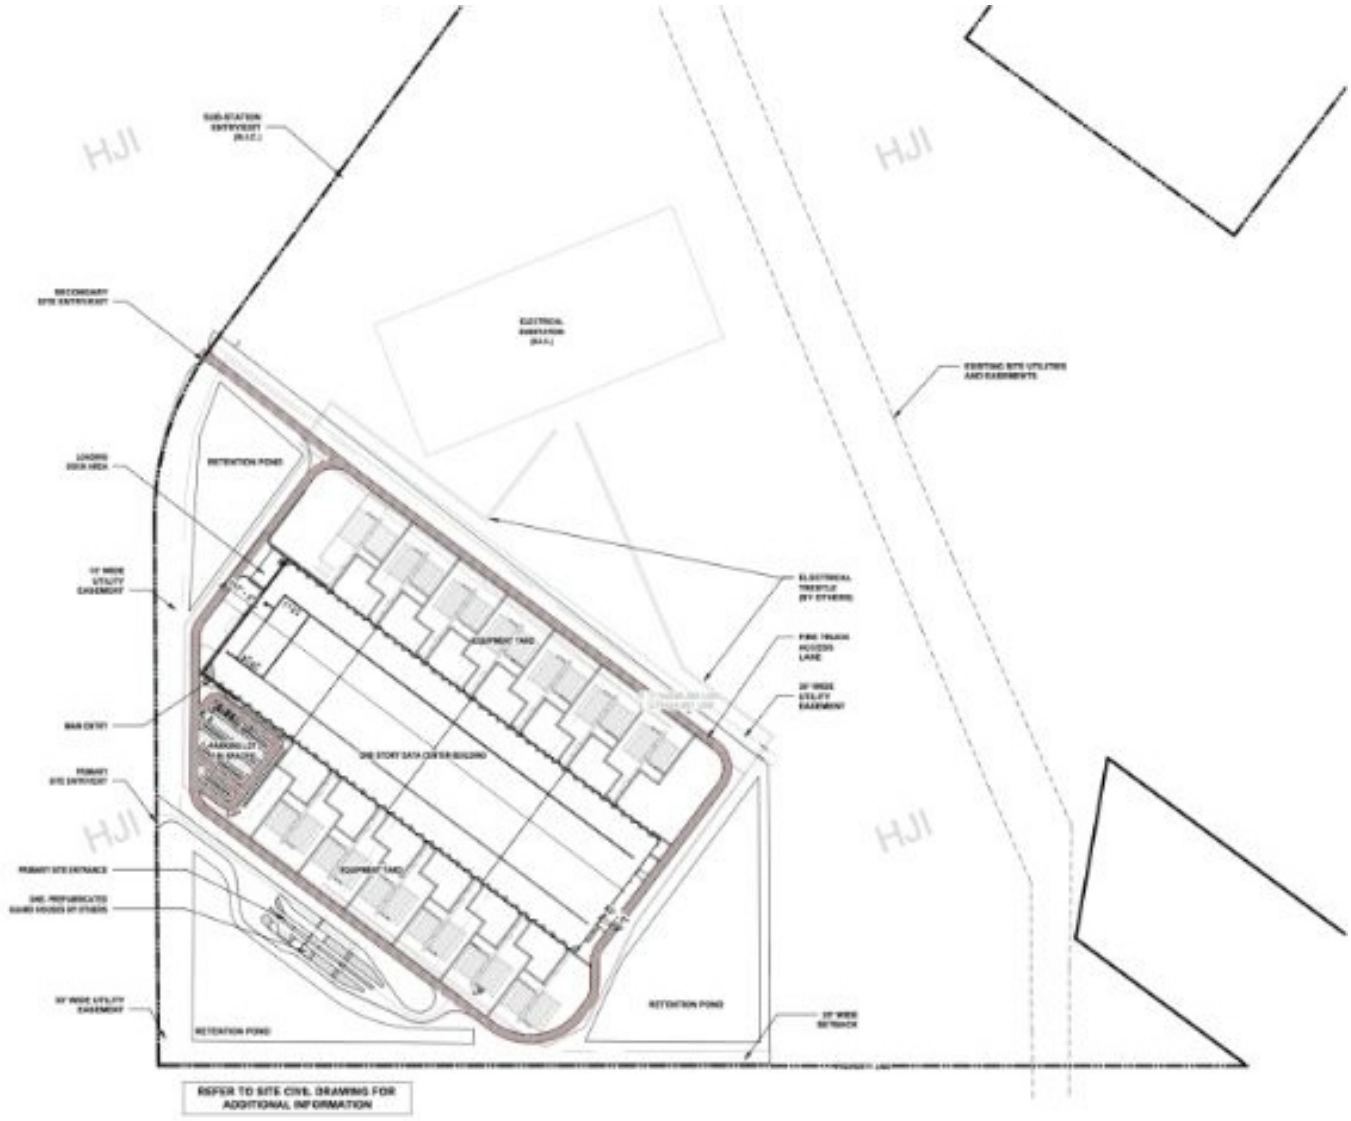

Source: Local Filings; Grand Prairie Campus Site Plan

Hut 8 Corpus Christi

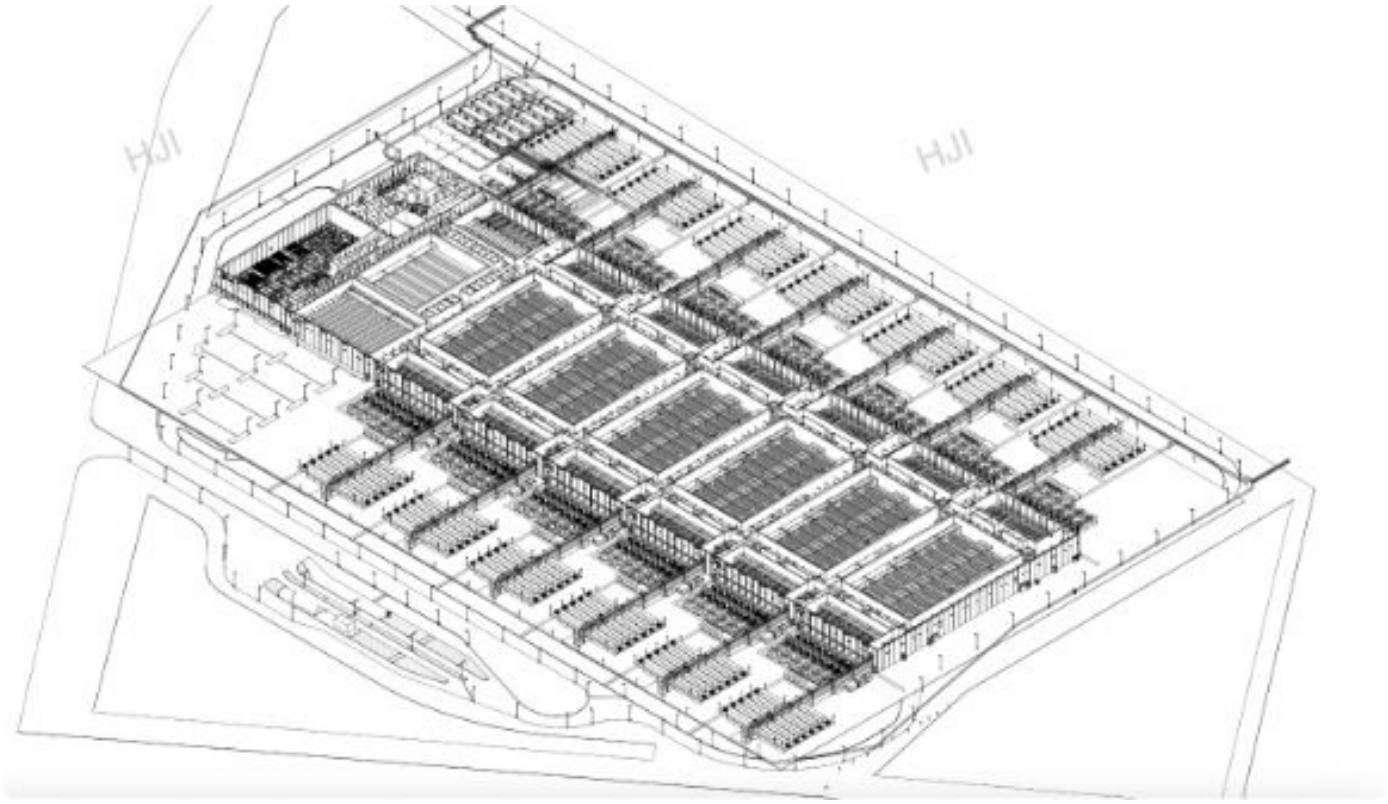

704MW of IT capacity across two 352MW phases is contracted at Hut 8's Beacon Point campus near Corpus Christi, Texas, supported by a 1GW power campus. We expect Phase I delivery from Q4 2027 through Q2 2028 and Phase II from Q2 2028 through Q1 2029, placing initial operations one quarter behind management's Q3 2027 target. First energization is targeted for Q1 2027, but vertical construction remains unconfirmed, and we continue to classify the project as planned. NVIDIA is identified as the contractual tenant, with Lambda taking over a reassigned lease and Anthropic identified as the end user for one 352MW tranche.

Source: SemiAnalysis Datacenter Industry Model; Hut 8, Corpus Christi area, Texas, United States, August 23, 2026.

Source: Local Filings; Hut 8 Beacon Point (Corpus Christi) Campus Site Plan

Source: Local Filings; Hut 8 Beacon Point (Corpus Christi) Campus Site Plan

Hut 8 River Bend, Louisiana

245MW of IT capacity is planned at Hut 8's River Bend campus in Louisiana. We expect initial operations in Q3 2027 and phased completion by Q1 2028, starting one quarter later than management's Q2 2027 target. Fluidstack is the tenant under a 15-year, $7 billion lease, with Anthropic as the end user and a springing Alphabet guarantee covering the full base term. Vertical construction began in June 2026, though only a third of the facility shell has been built out.

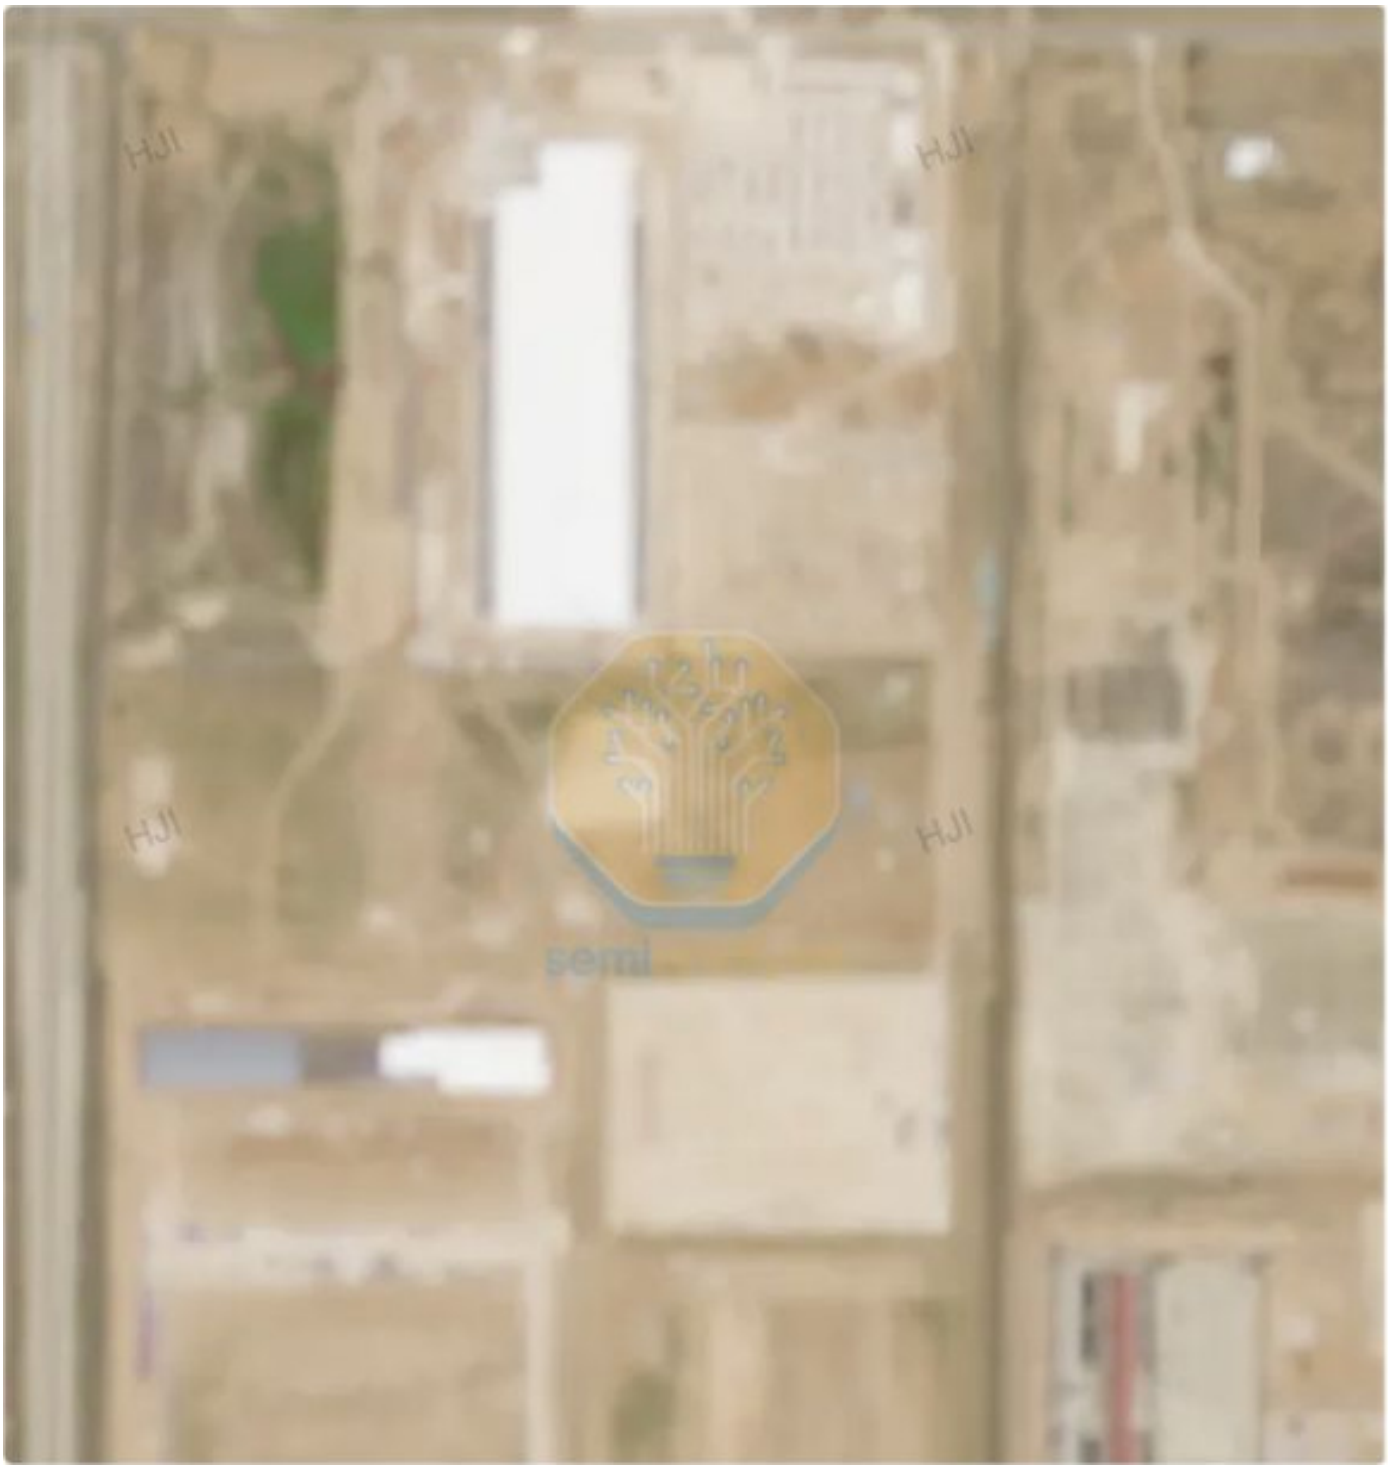

Source: SemiAnalysis Datacenter Industry Model; Hut 8 River Bend, Louisiana, United States, August 22, 2026.

Source: Local Filings; Hut 8 River Bend (West Feliciana Parish, Louisiana) Campus Site Plan

TeraWulf Abernathy

Abernathy was originally targeted for delivery in H2 2026. We now expect first capacity in Q1 2027 and the full 168MW online by Q2 2027. Fluidstack acquired TeraWulf's entire 50.1% interest in the Abernathy, Texas joint venture for approximately $530 million, in a sale announced on July 6, 2026. Payments are staged, with $250 million received in July, approximately $150 million due by December 31, 2026 and $130 million by April 30, 2027. The site is in the SPP grid region, and the sale represents a reported 20% IRR for TeraWulf.

Source: SemiAnalysis Datacenter Industry Model; TeraWulf Abernathy, Texas, United States, August 17, 2026.

TeraWulf Lake Mariner

336MW of IT capacity across CB-4 and CB-5 (168MW each) is contracted to Fluidstack at TeraWulf's Lake Mariner campus in New York, with Google credit backstops. We expect CB-4 to ramp from Q1 through Q2 2027 and CB-5 from Q2 through Q3 2027, placing CB-4 behind management's late-September 2026 first-hall target. CB-1 and CB-3 are already online, providing 102MW of revenue-generating IT capacity, while CB-4's first data hall is in commissioning.

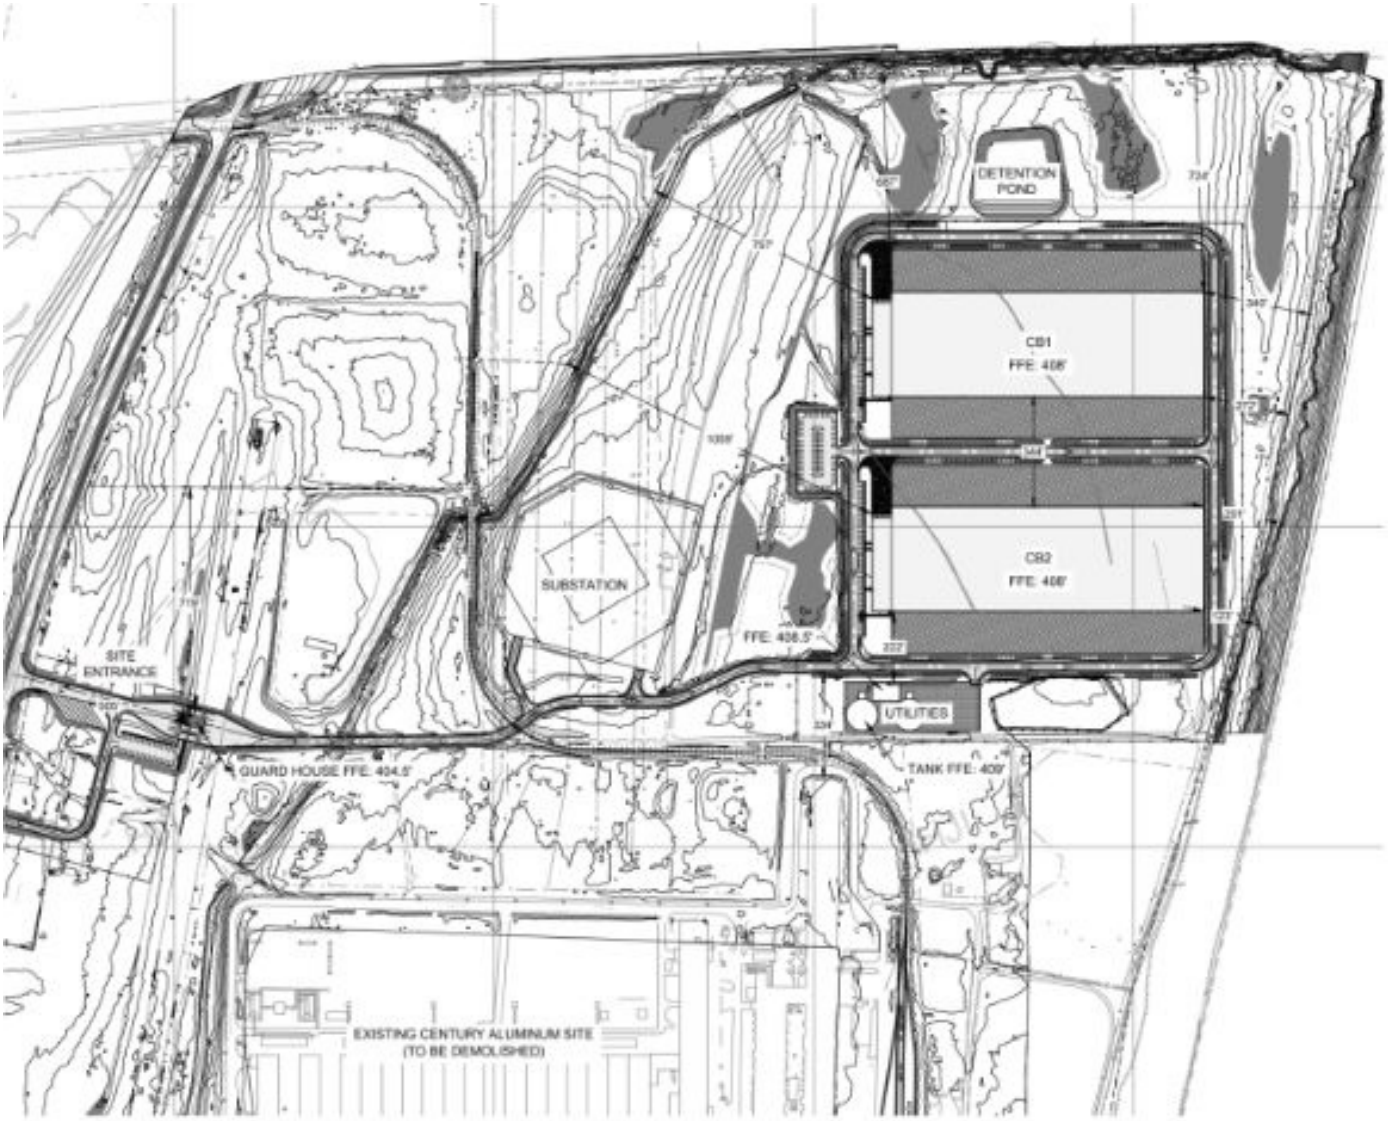

Source: SemiAnalysis Datacenter Industry Model; TeraWulf Lake Mariner, Barker, New York, United States, July 23, 2026.

TeraWulf Hawesville

401MW of IT capacity is contracted directly to Anthropic at TeraWulf's Justified Data Campus in Hawesville, Kentucky, under a 20-year lease valued at approximately $19 billion. We expect initial operations in Q4 2027, ramping through Q2 2028, within management's H2 2027-H1 2028 delivery window. The former Century Aluminum smelter site is supported by a 482MW maximum demand power agreement with Big Rivers, supplied from MISO and approved by the Kentucky Public Service Commission on August 21, 2026.

Source: SemiAnalysis Datacenter Industry Model; TeraWulf, Hawesville, Kentucky, United States, August 21, 2026.

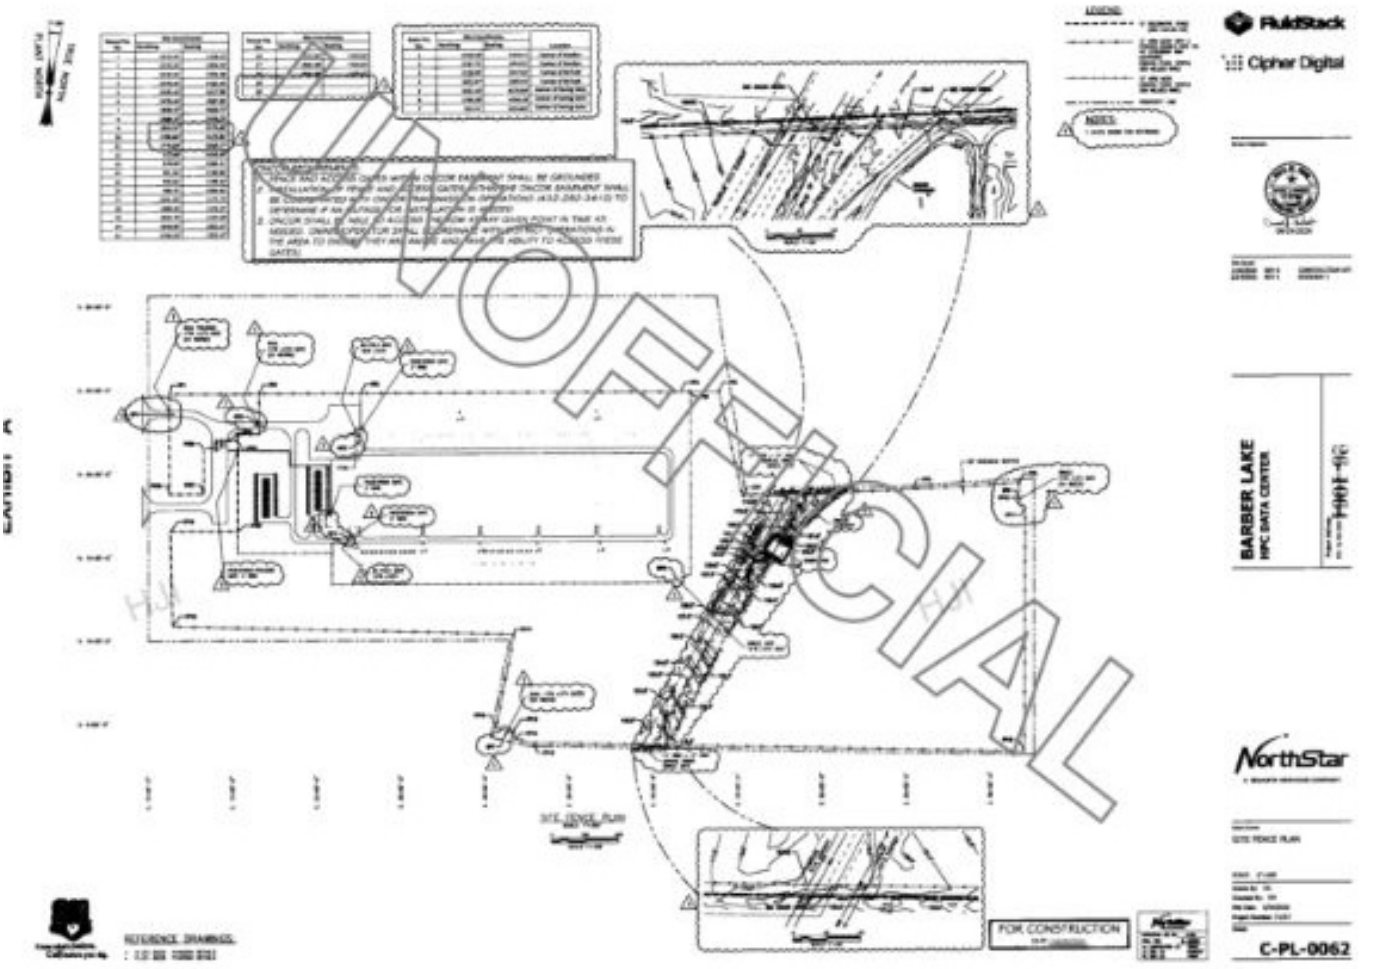

Source: Local Filings; TeraWulf Hawesville Campus Site Plan

Cipher Barber Lake

207MW of IT capacity (300MW gross) is planned across two phases at Cipher's Barber Lake campus near Colorado City, Texas. We expect the 168MW first phase to ramp from Q4 2026 through Q1 2027 and the 39MW second phase from Q1 through Q2 2027, with a separate, unleased 333MW IT expansion modeled from Q2 2030 through 2032. Construction began in November 2025 and topped out in April 2026. Fluidstack is the tenant, with Anthropic named as occupant in state filings and Google backstopping approximately $1.73 billion of lease obligations.

Source: SemiAnalysis Datacenter Industry Model; Cipher, Barber Lake, Texas, United States, August 19, 2026.

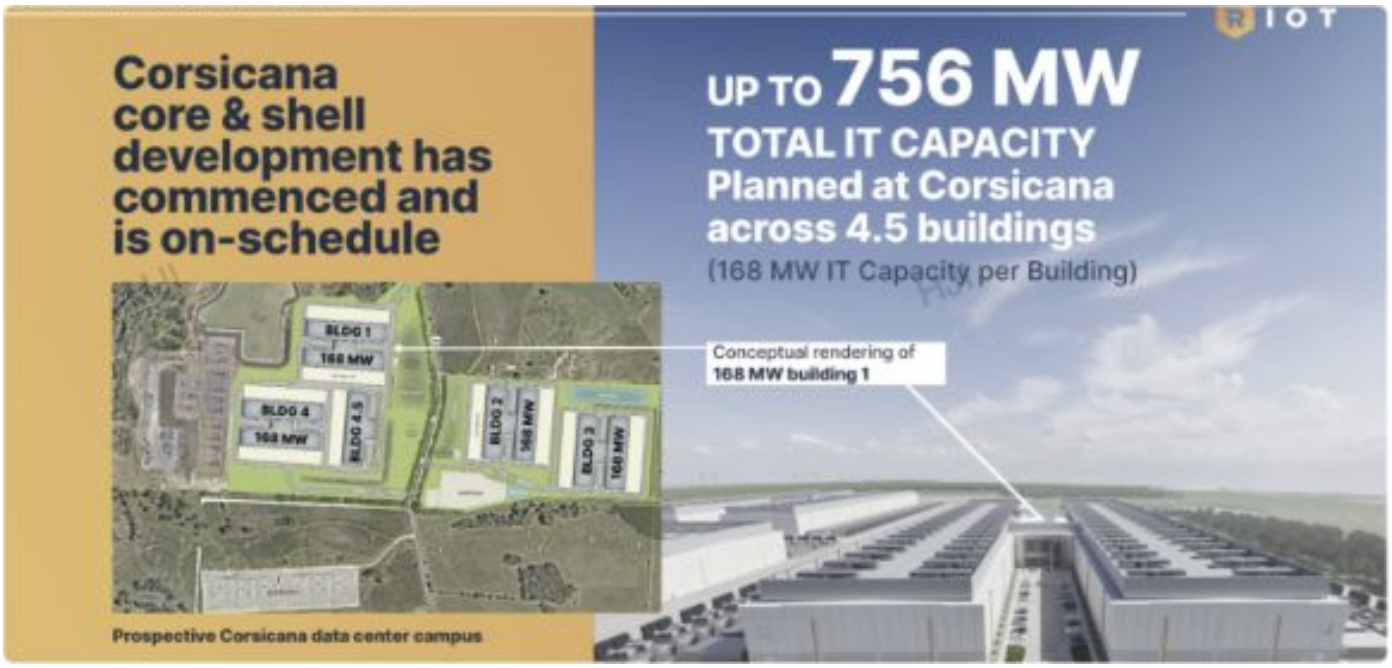

Source: Local Filings; Cipher Barber Lake Campus Site Plan

Riot Corsicana

Up to 756MW of IT capacity is planned at Riot's Corsicana campus in Texas, backed by 1GW of ERCOT approved power, including 400MW already energized for Bitcoin mining. We expect initial operations in Q1 2028, ramping through 2029, subject to lease execution, and believe Anthropic is the likely end user. The first core and shell building is under development, while the entire campus is under a non-binding LOI with a single tenant with no lease signed yet.

Source: SemiAnalysis Datacenter Industry Model; Riot, Corsicana, Texas, United States, August 28, 2026.

Source: RIOT Platforms Quarterly Report Q1 2026

TeraWulf Muskie

800MW of IT capacity across two 400MW phases is planned at TeraWulf's Muskie Data Campus in eastern Kentucky, supported by 1GW of contracted electric service from Kentucky Power. We expect the first phase to begin operations in Q4 2028 and ramp through 2030, with the second starting in Q4 2030 and ramping through 2032. Construction has not started and no tenant is secured, we believe Anthropic may be interested though having no Google backstop. Delivery depends on a new utility substation and transmission lines, with regulatory filings expected in 2027.

Source: Local Filings; TeraWulf Muskie Campus Site Plan

Hyperscaler builds

AWS Project Rainier Indiana Edison Road

We expect 120MW of capacity (60MW per building) to come online in Q3 2026 at AWS' Project Rainier Buildings 8 and 9. Both buildings had topped out by April 20, 2026, with fit-out and cooling equipment installation underway, following construction starts in August and September 2025, respectively.

Source: SemiAnalysis Datacenter Industry Model; AWS Project Rainier, Edison Road, Indiana, United States, July 14, 2026.

AWS Project Rainier Georgia

Approximately 240MW across four buildings is expected at Project Rainier's Covington, Georgia campus, assuming 60MW per building. Delivery is estimated for Q3 2026 for Building 1, Q4 2026 for Building 2 and Q1 2027 for Buildings 3 – 4, based on the 11 month timeline; the first two had topped out by February 2026, with cooling equipment installation visible from March, while construction on Buildings 3 – 4 became visible in March and both had topped out by August.

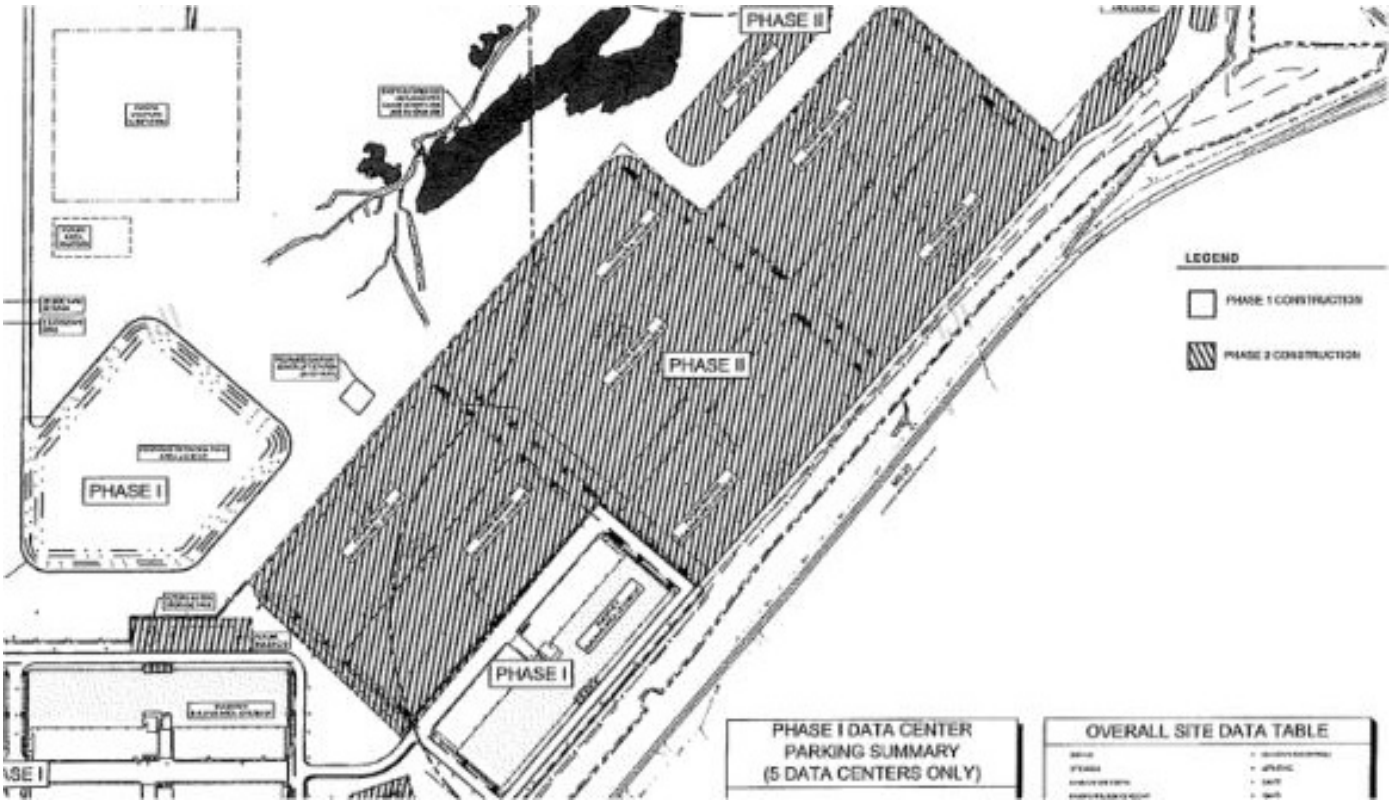

Source: SemiAnalysis Datacenter Industry Model; AWS Project Rainier, Georgia, United States, August 23, 2026.

AWS Project Rainier Mississippi – Canton

Approximately 420MW across seven new buildings is expected at Project Rainier campus in Canton, Mississippi, with delivery forecast for Q1 2027 for Buildings 1 – 4 and Q2 2027 for Buildings 5 – 7. 60MW per building, with the expansion joining five original data centers, with construction first visible on Buildings 1 – 2 in Q1 2026, Buildings 3 – 4 in Q2 and Buildings 5 – 7 in Q3; the first four had topped out by Q3, while work on the remaining three continued through August.

Source: SemiAnalysis Datacenter Industry Model; AWS Project Rainier, Mississippi, United States, September 3, 2026.

Source: Mississippi State Filings, Building Plans

AWS Project Rainier Mississippi – W County Line Road

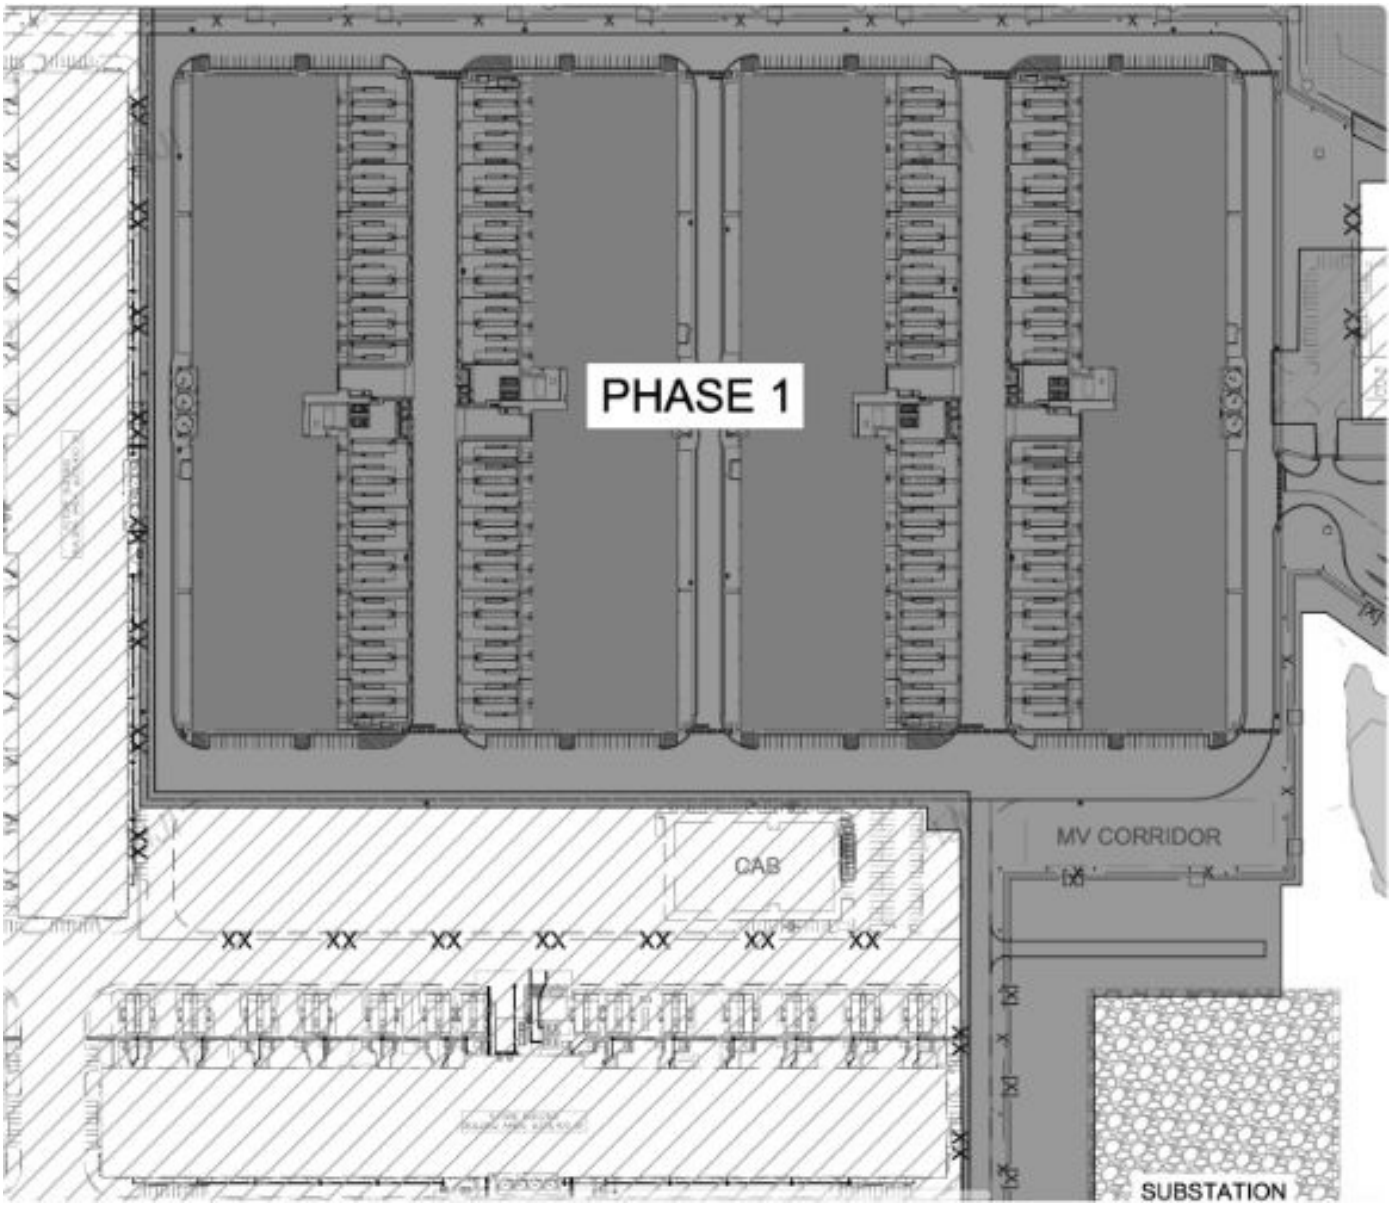

AWS's Ridgeland, Mississippi campus has 300MW across the five buildings we are tracking, with 60MW per building. Construction of the remaining 60MW building started in Q1 2026, with its roof complete and cooling/electrical infrastructure being installed by Q3 2026, according to our site checks. We expect an 11 month construction period, placing completion in Q1 2027.

Source: SemiAnalysis Datacenter Industry Model; AWS Project Rainier, Mississippi, United States, July 27, 2026.

AWS Project Rainier Pennsylvania

Approximately 208MW of capacity (104MW per building) is planned across Buildings 4 and 5 at AWS's Pennsylvania site, with completion expected in February 2027 and May 2027, respectively which we believe to be leased out to Anthropic. Construction began on Building 4 in late March 2026 and Building 5 in June, with both showing substantial roof coverage by August 12.

Source: SemiAnalysis Datacenter Industry Model; AWS, Electron Avenue, Pennsylvania, United States, August 12, 2026.

Source: Pennsylvania State Filings, Building Plans

AWS Project Rainier Pennsylvania 2 – Fairless Hills

Approximately 300MW across the first five expansion buildings is expected at AWS's Fairless Hills campus, with delivery forecast for Q1 2027 for Building 1 and Q2 2027 for Buildings 2 – 5 which we believe is leased out to Anthropic. This assumes 60MW per building and an 11 month construction period, following observed starts between April and July 2026. We believe building 6 construction will start within a month, and expect the rest to follow the 1.5 month stagger. Our model puts the campus total at 600MW, including up to 10 data centers once fully built out.

Source: SemiAnalysis Datacenter Industry Model; AWS, Fairless Hills, Pennsylvania, United States, August 21, 2026.

Source: Amazon Innovation in PA Renders

Google Fort Wayne

AEP/PJM filings show a request for up to 480 MW of utility demand by November 2026, rising to 1.2 GW by July 2029, which we associate with Google's Fort Wayne campus based on AEP's Project Zodiac map. We estimate six large expansion buildings at 87 MW of IT capacity each, adding 552 MW alongside the earlier H-shaped facility. We model the three expansion buildings under way entering service in Q4 2026, Q1 2027 and Q3 2027, with the fourth following in Q1 2028, and tag the whole campus to Anthropic.

Google's initial facility was already operating by December 2025, when two additional buildings were reported under construction. The broader campus is planned for up to seven DC buildings in total within an approximately 858 acre permitted area. The site plan places three buildings in Phase 2 and another three in Phase 3, following the initial facility. The applicant schedule extends Phase 2 construction through June 2028 and Phase 3 through 2030, covering the wider campus buildout. Phase 3's isolated wetland permit became effective on September 10, 2026.

Source: SemiAnalysis Datacenter Industry Model; Google, Fort Wayne, Indiana, United States, August 19, 2026.

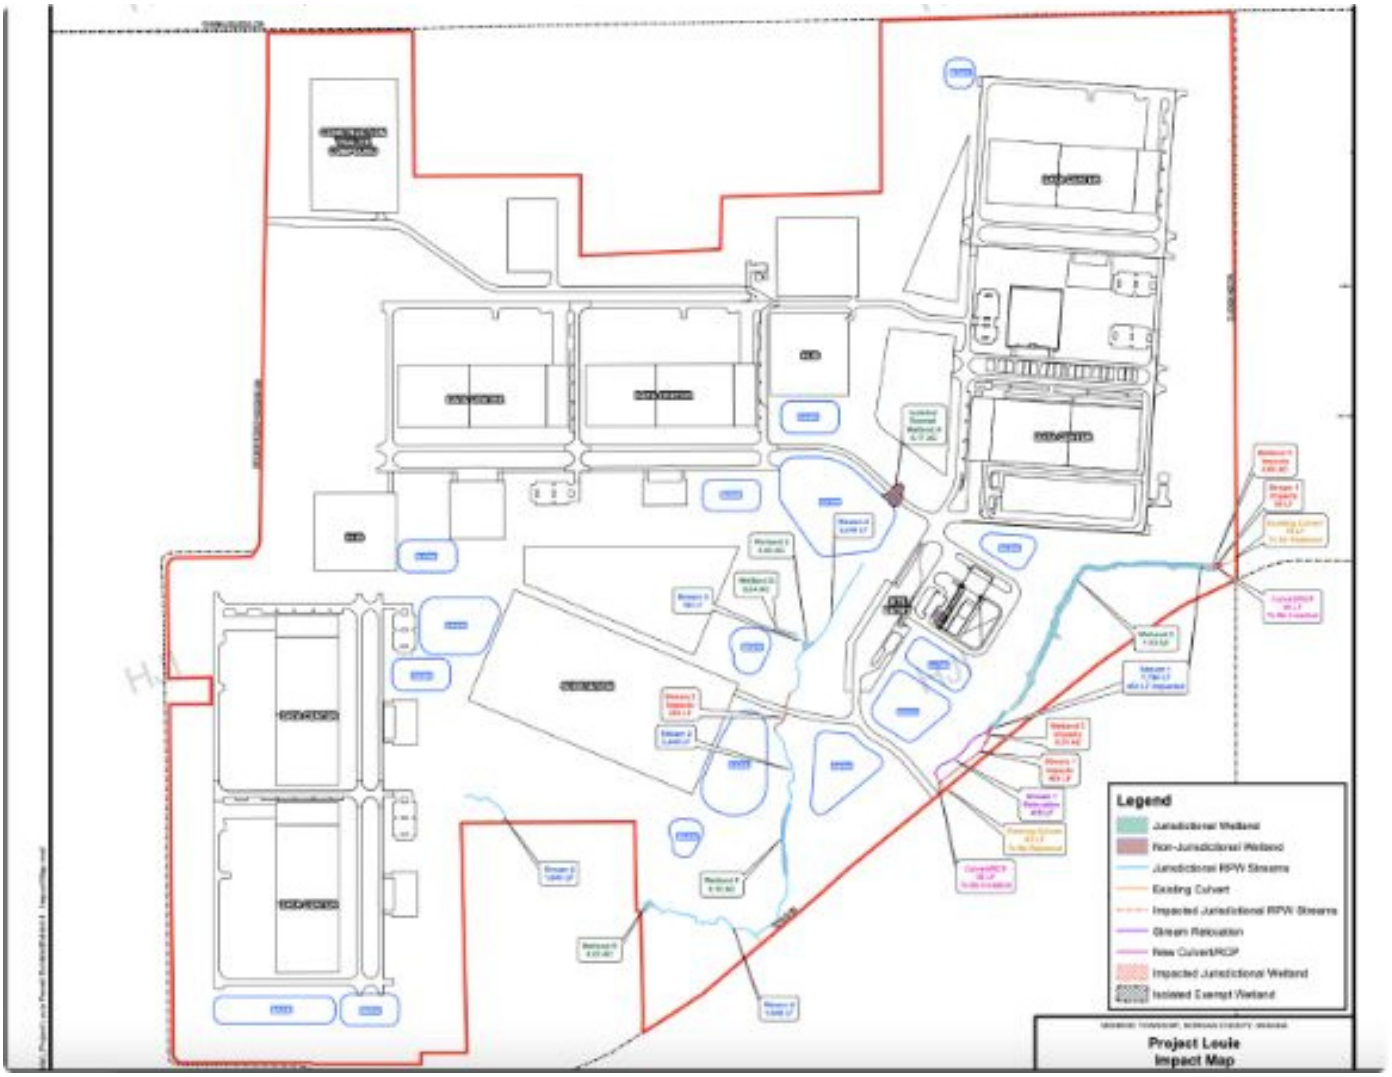

Source: Local Filings; Google Fort Wayne Campus Site Plan

Google Mooresville

We track Google's Monrovia/Mooresville, Indiana campus at 500MW IT as a Google TPU site that could serve Anthropic, though our model currently tags it to Google DeepMind, with first phase operations targeted for Q4 2027 and the building shell close to completion as of September 13. Construction began in late June 2026, and the shell assessment is consistent with our satellite checks. Project Louie's environmental application covers up to six buildings across 469 acres, filings distinguish Louie 1 and 2; Louie 2 received structural release in May and architecture/MEP/fire-alarm release in August 2026. Contractor notes describe a switch from metal construction to precast at the project working with Holder, containing CMDA buildings. AES's filed Phase 1 agreement specifies 390MW contracted demand at full ramp, its associated construction agreement sets November 30, 2029 for full operation. Separately, MISO materials evaluate a 1.2GW load addition and list November 2027 for Antioch transmission service.

Source: SemiAnalysis Datacenter Industry Model; Google, Mooresville, Indiana, United States, September 10, 2026.

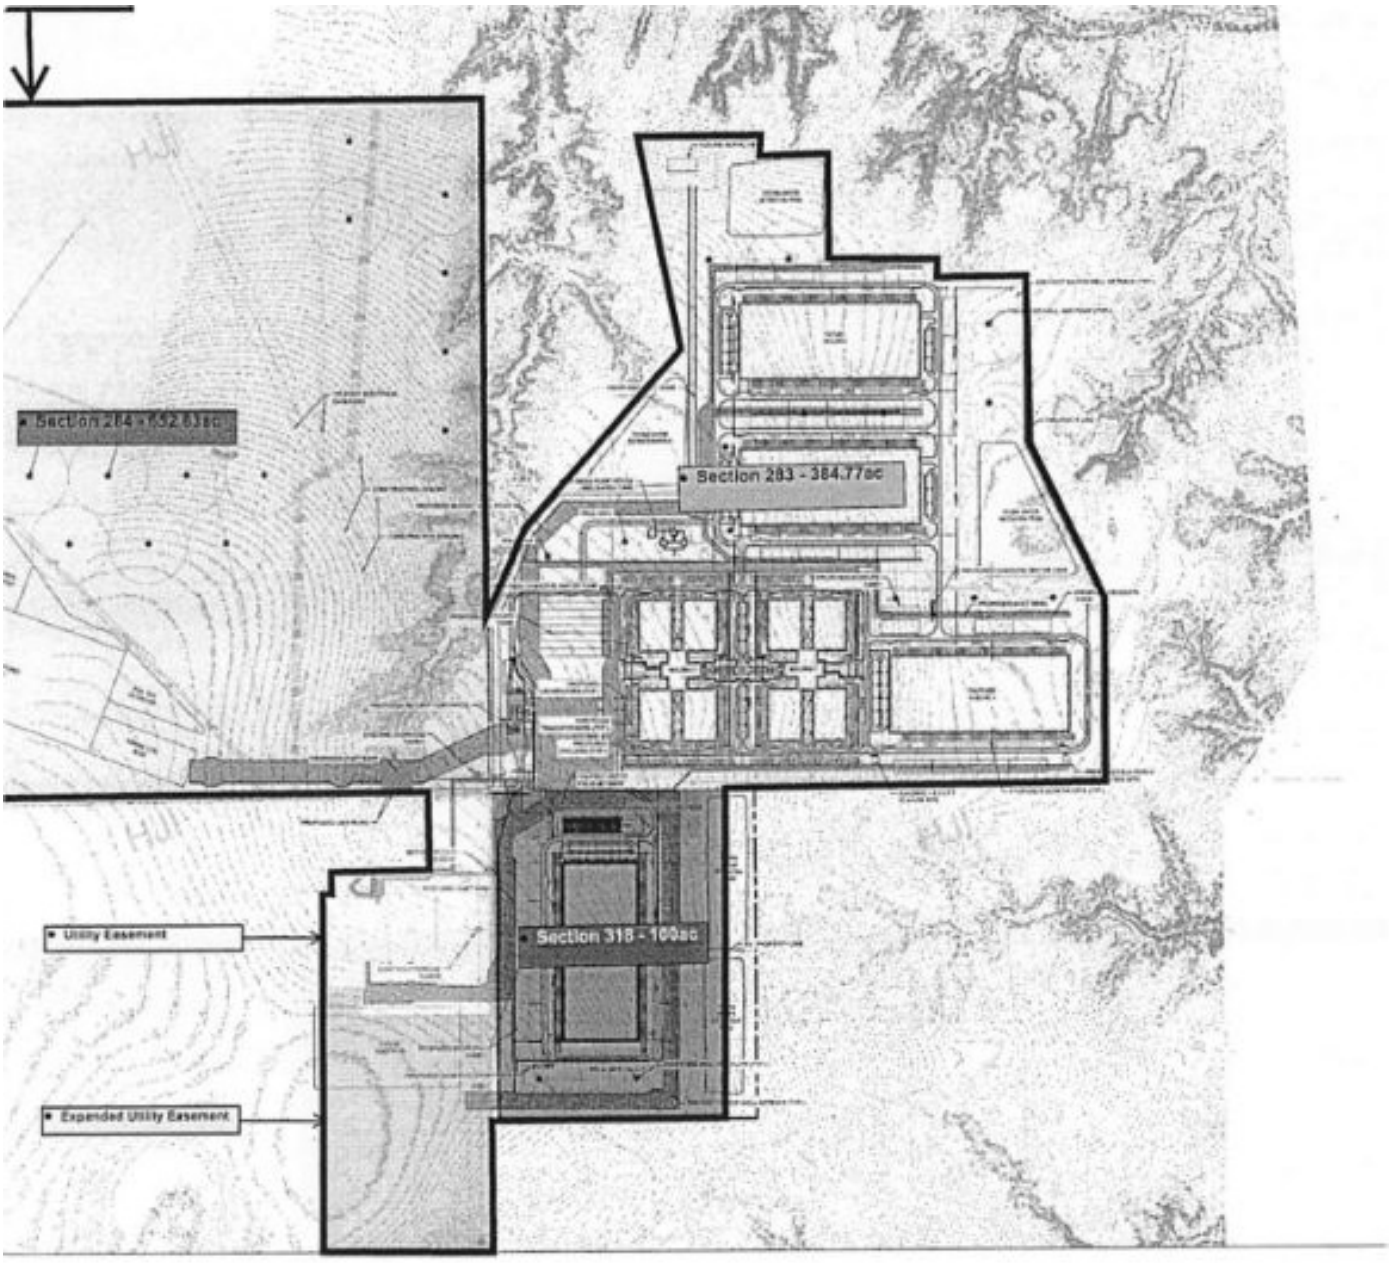

Source: Local Filings; Google Mooresville Campus Site Plan

Google Goodnight/Amarillo

Google’s Goodnight campus in Texas has an estimated capacity of 1,006MW across six buildings. The two 103MW buildings started construction in Q3 and Q4 2025 and are expected to begin operations at full capacity in Q3 and Q4 2026, respectively. Two 200MW buildings started construction in Q1 2026, with operations forecast for Q1 2027 and full capacity in Q3 2027. The remaining two 200MW buildings started construction in Q2 2026 and are expected to begin operations in Q2 2027, bringing the campus to full capacity in Q4 2027.

Source: SemiAnalysis Datacenter Industry Model; Google, Goodnight, Amarillo, Texas, United States, July 24, 2026.

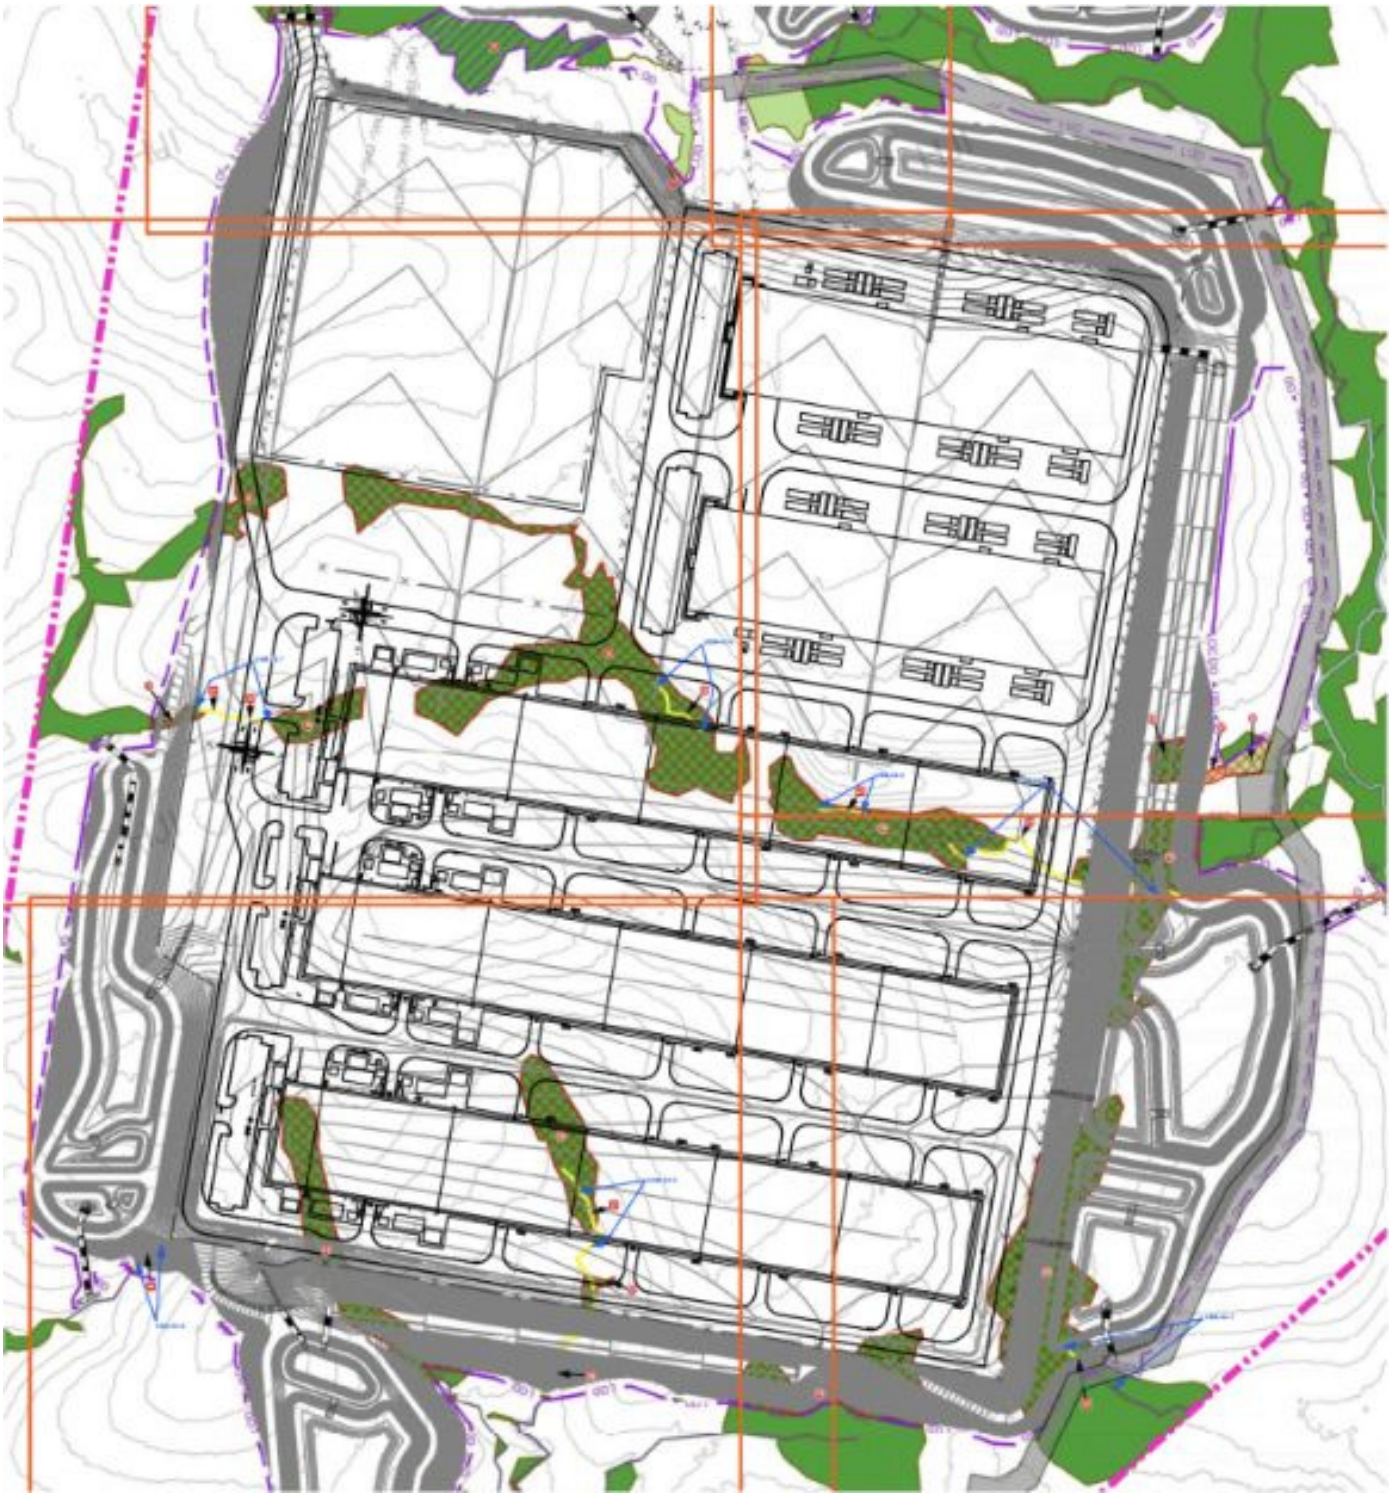

Source: Local Filings; Google Amarillo Campus Site Plan

Microsoft Clarksville

Microsoft's Clarksville (Lakeside) campus in Virginia has an estimated utility load of 48MW per building, with only 2 out of 5 buildings built so far. Building 2 appears to have reached construction completion in Q3 2026, following a June 2025 construction start. The adjoining three-building expansion remains in permitting, with a state wetlands permit decision targeted for Q4 2026, grading planned for 2027 and final construction phases forecast through Q4 2032.

Source: SemiAnalysis Datacenter Industry Model; Microsoft, Clarksville, Virginia, United States, August 20, 2026.

Source: Local Filings; Microsoft Clarksville Campus Site Plan

Fluidstack Indiana

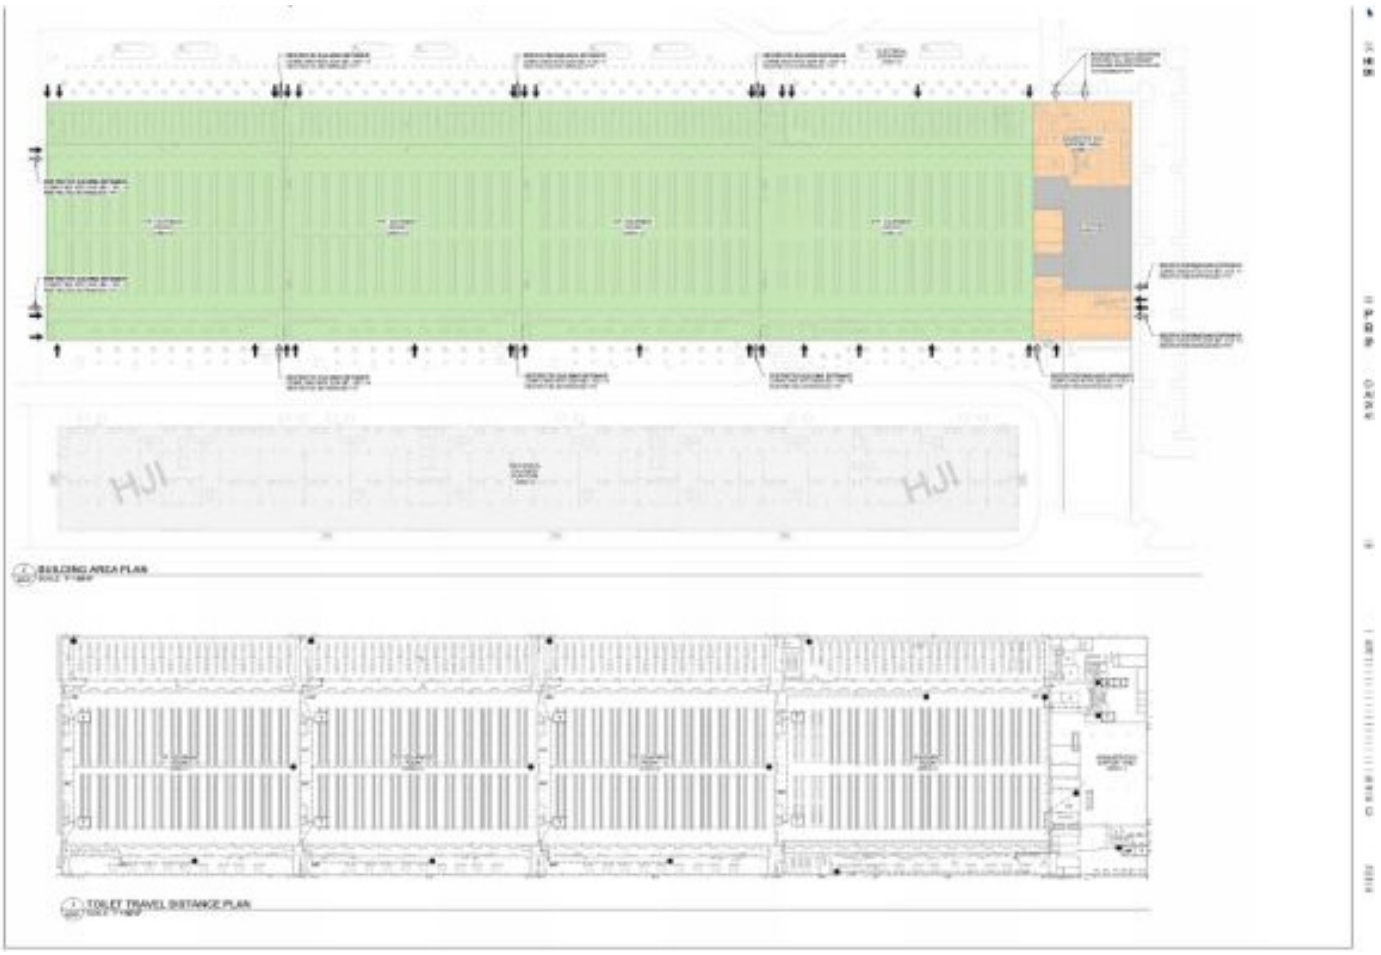

Fluidstack's Sullivan County campus is planned for an initial 430MW of critical IT capacity across two buildings, and we expect the first building to begin delivering in Q3 2027 and the second in Q4 2027, with the full 430MW online by Q1 2028, following the start of shell construction on the first building in early September 2026. Our research identifies Anthropic as the end user on TPUs. IND101 and IND102 received state design releases in June and July, respectively, while Phase 2 wetland authorization took effect on September 7.

Meridian Arc's $5.7bn note offering supports the initial buildings of 245MW and 185MW of critical IT capacity. Fluidstack and Next Frontier are the JV partners, with Google guaranteeing Fluidstack's lease obligations. Fitch's May power schedule targeted 300MW in December 2026 and a further 320MW in March 2027 which we believe to be accurate. Potentia markets the wider Heartland park at 1,000+ acres and 2.1GW+, with $65bn of

anticipated tenant/partner investment through 2030. The March county agreement describes two Phase 1 buildings and five Phase 2 buildings, although the recovered document lacks developer signatures yet. The 1GW+ expansion remains unsigned, awaiting Google, with delivery leaning 2028.

Asia Pacific

Australia

Colocation providers and developers

AirTrunk MEL2 Tullamarine

AirTrunk has downsized MEL2 from 350MW to 240MW after AWS withdrew as the intended anchor tenant, Microsoft signed 108MW in 3Q26, with delivery targeted for Q4 2027. The remaining 132MW has no confirmed tenant. We keep the site in this note because AWS was the intended anchor, and its withdrawal removes a candidate Anthropic site in Melbourne. Microsoft taking the full 240MW campus is the most likely outcome, although AWS participation or some capacity remaining unleased are still possible. The existing building remained standing in February 2026 but had been demolished and the site cleared by June. August imagery shows early construction activity, while September imagery appears to show the first section entering vertical construction.

Source: SemiAnalysis Datacenter Industry Model; AirTrunk MEL2, Tullamarine, Australia, September 1, 2026.

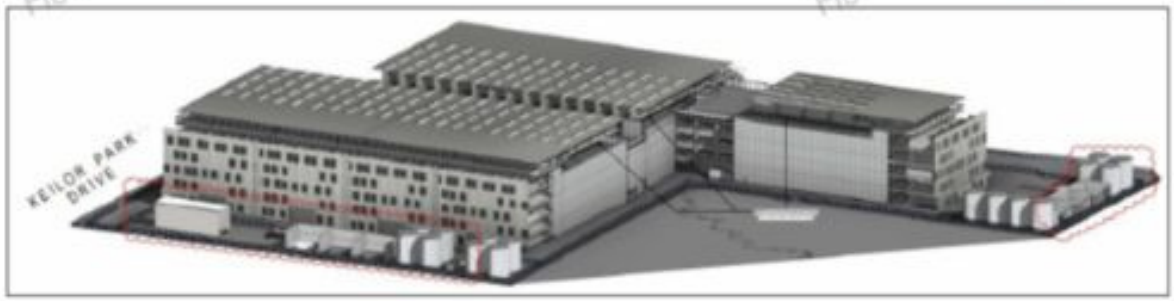

Figure 1 – Architectural render of the proposed development as viewed from the south.

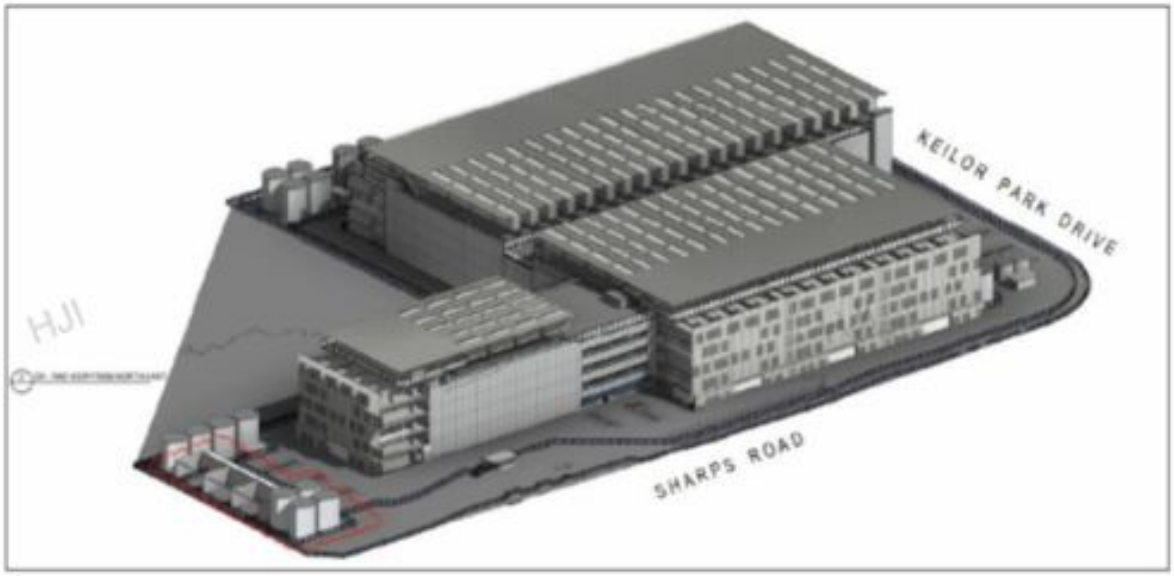

Figure 2 – Architectural render of the proposed development as viewed from the north-east.

Building Render

Source: Local Filings; AirTrunk MEL2 Campus Site Plan

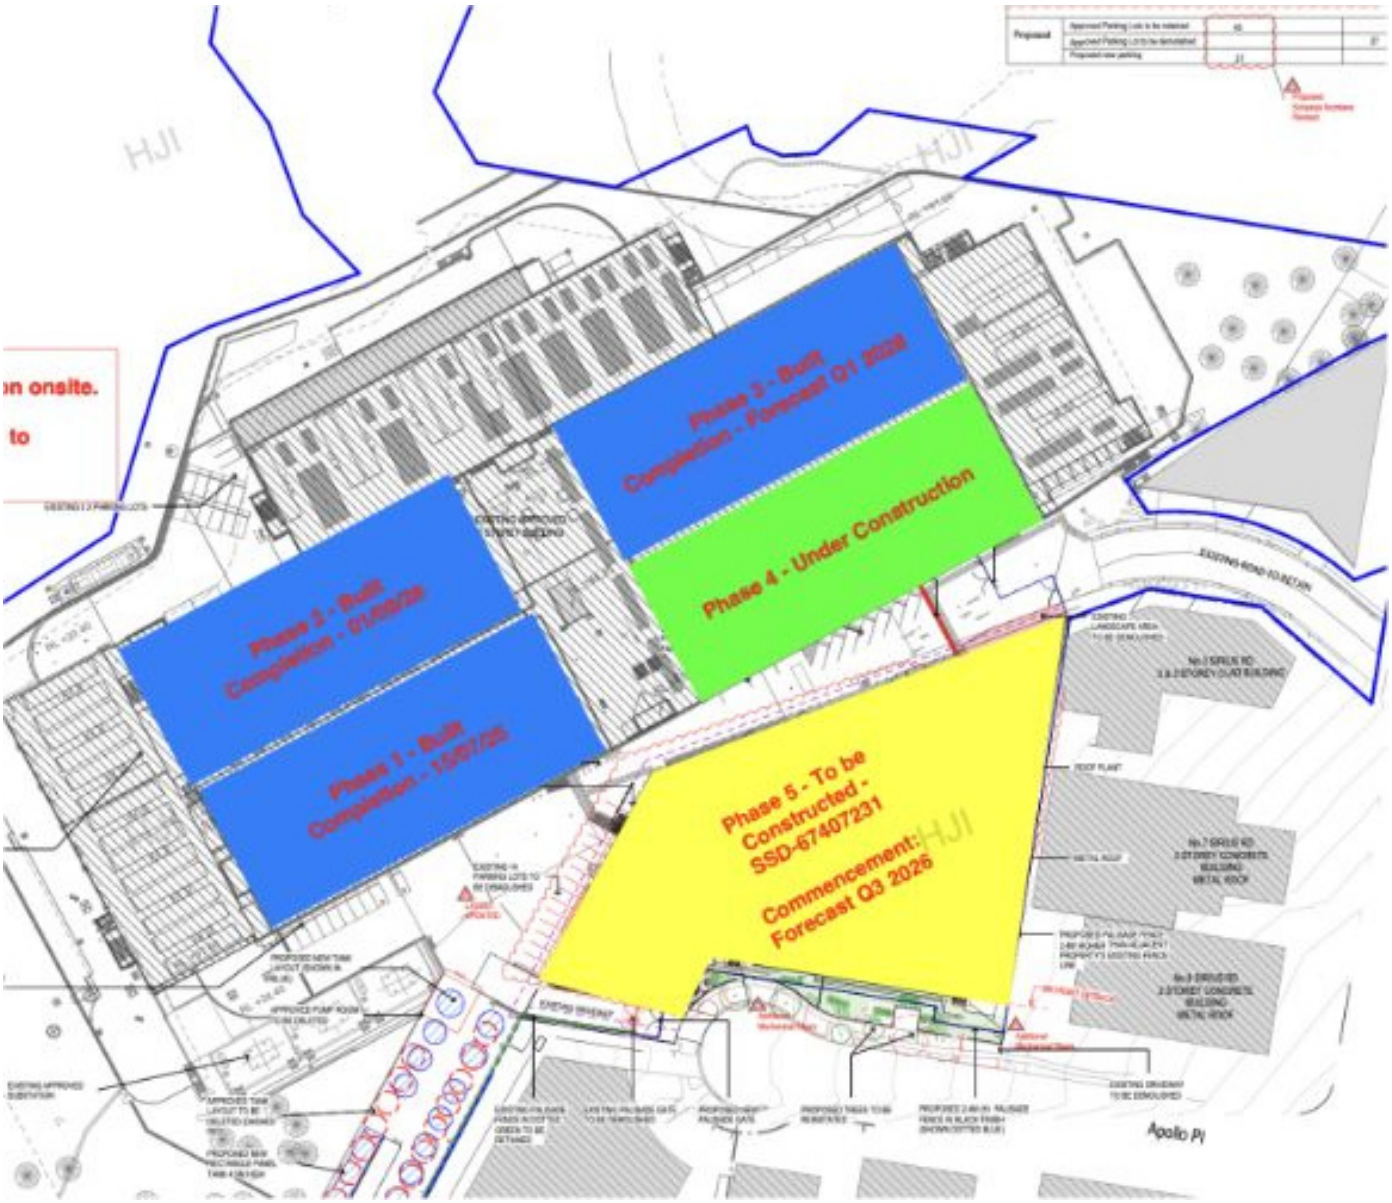

AirTrunk SYD2A Lane Cove West

AirTrunk's SYD2 campus is listed at 158MW+ in the company's December 2025 portfolio announcement, with Phase 4 under construction. AirTrunk announced completion of a 30MW Phase 3 expansion in August 2024, although individual data halls continue to come online in stages. An April 2026 operating report recorded Phase 1 as operational, alongside three of four halls in Phase 2 and three of five in Phase 3. The July staging plan forecast further customer handovers for Phase 2 in September 2026 and Phase 3 in Q1 2028, despite both being classified as built. Phase 4's handover date remained unspecified in AirTrunk's April document set, which mentioned no customer for that phase at the time. February and September 2026 imagery suggests Phase 4's roof structure was substantially built by February, while large rooftop cooling arrays were not visible in September and the adjoining generator building remained under construction.

The adjoining Phase 5 expansion, known as the Apollo Place Data Center, received NSW planning approval October 2025 for 45MW of power consumption. Its planning application describes four data halls, with infrastructure shared with the existing campus. The 45MW figure refers to facility power consumption, our IT capacity estimate is 30MW. AirTrunk's July 2026 staging plan forecast construction commencement in Q3 2026, and we estimate delivery in Q1 2028, though we have yet to see any construction at the site.

Source: SemiAnalysis Datacenter Industry Model; AirTrunk SYD2A, Lane Cove West, Australia, September 12, 2026.

Source: Local Filings; AirTrunk SYD2 Campus Site Plan

CDC LA1 and LA2 Truganina

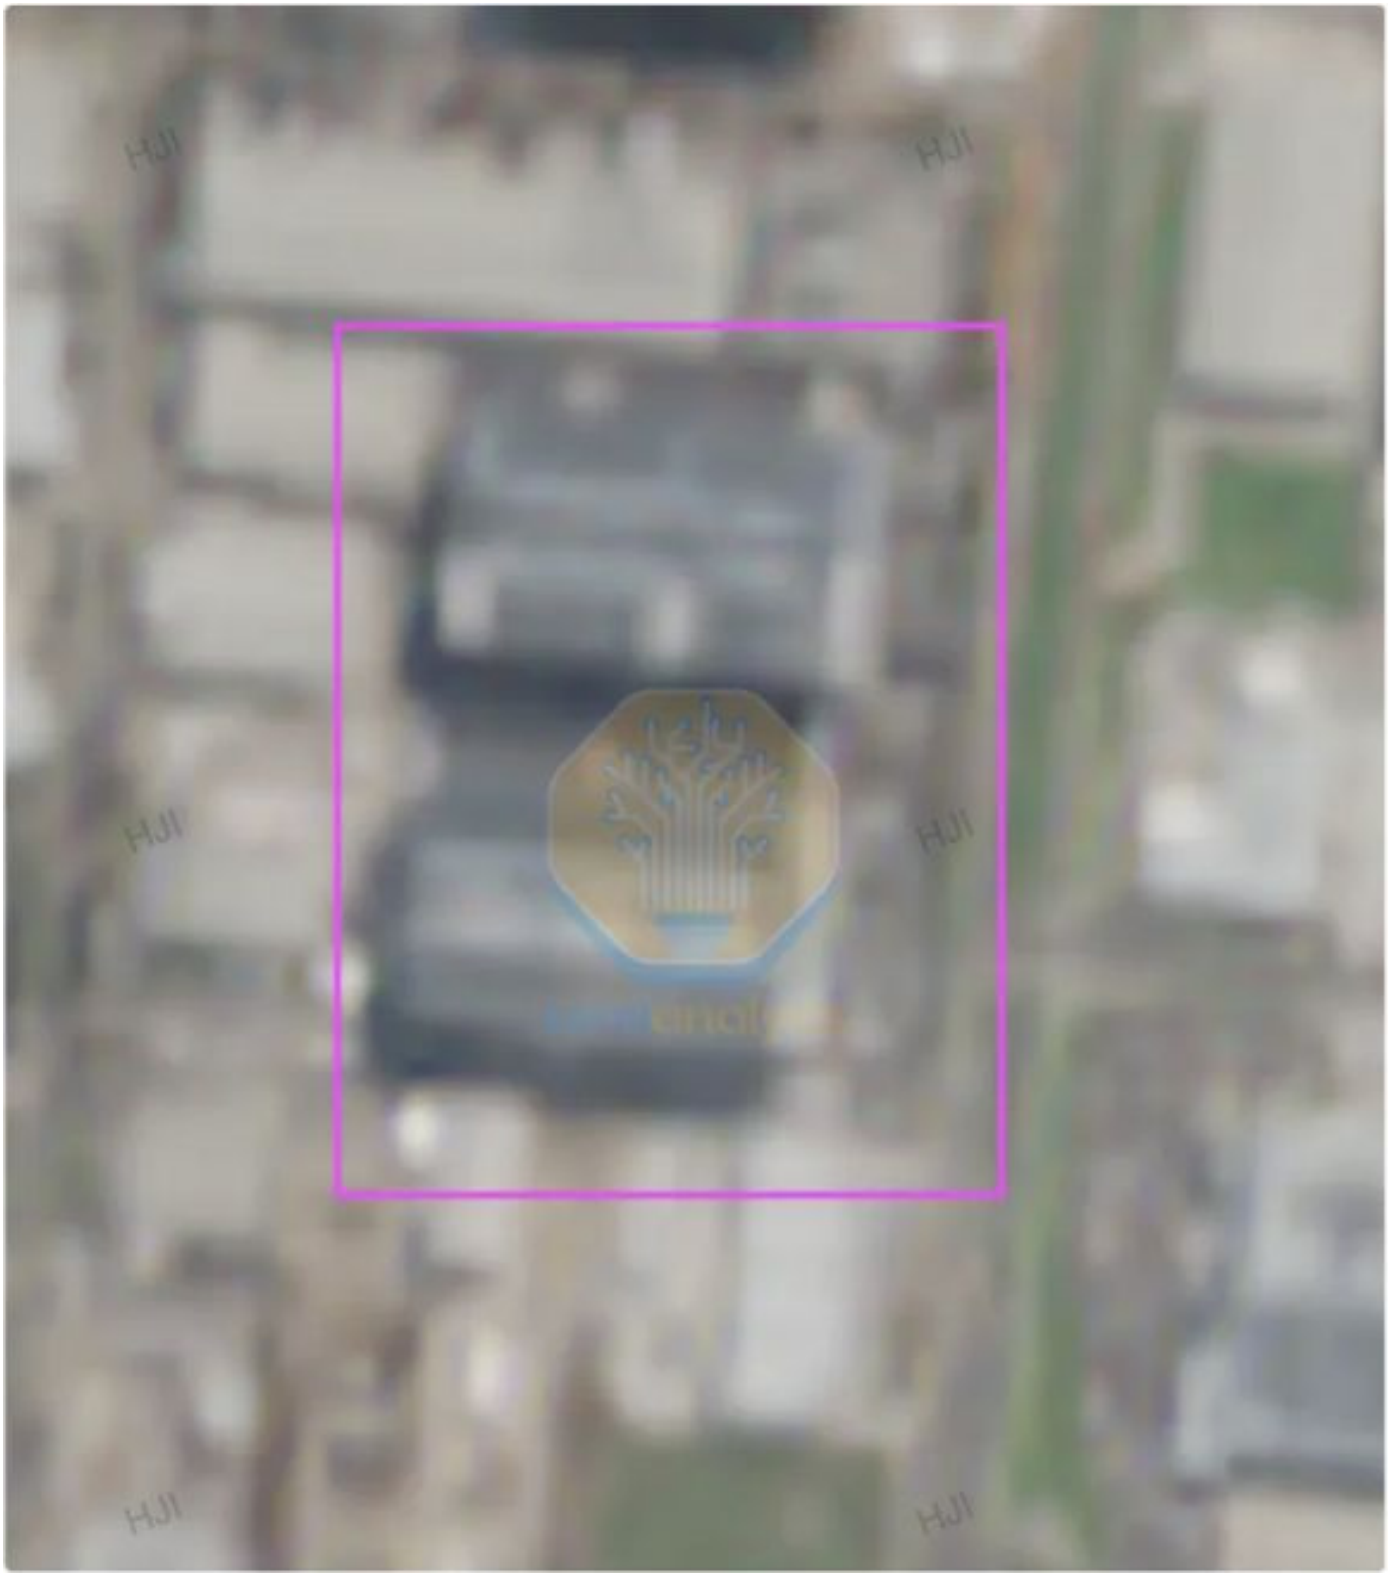

CDC's planned Melbourne campus is to add more than 400MW IT, including 150MW in Phase 1. We now expect DC1 to come online in Q1 2027 and DC2 in Q2 2027. Construction on DC1 began in August 2025, with infrastructure work on DC2 underway by November. By June 2026, DC1 was nearing topping out and DC2 had entered vertical construction, by September DC1 had topped out and was installing cooling/energy equipment while DC2 was topping out. We carry the campus as leased to AWS with Anthropic as the end user: 70MW in DC1, 65MW in DC2 and a further 160MW of planned expansion.

Source: SemiAnalysis Datacenter Industry Model; CDC LA1 and LA2, Truganina, Australia, September 8, 2026.

STACK MEL01 Truganina

We estimate STACK's MEL01C and MEL01D will deliver 54MW per building and begin operations in Q3 2026, under an AWS lease with Anthropic as the end user. Construction began in early May 2025, with both buildings topping out in November 2025 and rooftop cooling equipment installation underway in February 2026. The first MEL01A and MEL01B were both operational by Q4 2025 and brought 36MW per building online.

Source: SemiAnalysis Datacenter Industry Model; STACK MEL01, Truganina, Australia, August 17, 2026.

NEXTDC M3 West Footscray

M3 has 225MW of planned IT capacity, and we estimate the third building will begin operations in Q4 2026 with AWS as the tenant and Anthropic as the end user. Our model carries ~135MW of AWS capacity for Anthropic across the second and third buildings: 73MW in the second building, fully online by Q3 2026, and 62MW in the third building from Q4 2026. The third building was close to topping out in January 2026, with rooftop equipment installation underway in March and generators and chillers being installed in May. Our Q4 estimate allows five to six months for fit out after the May equipment installation. We estimate the first building went live in 1H 2023 and the second at the end of 2025.

Source: SemiAnalysis Datacenter Industry Model; NEXTDC M3, West Footscray, Australia, August 1, 2026.

NEXTDC M4 Port Melbourne

NEXTDC's M4 Port Melbourne campus is planned for 150MW, with a 10MW first phase, and we expect initial operations in Q1 2028 versus the original indicative 2027 opening target. Planning approval was granted on 16 January 2026, and NEXTDC confirmed early works had commenced in August 2026. Our latest satellite imagery shows early siteworks, with no visible vertical construction, making the original 2027 timeline look tight against the previously outlined 18-month build. Our Q1 2028 estimate refers to initial operations, not delivery of the full 150MW.

The planning assessment also identifies subsequent fire safety and utility requirements, alongside an environmental licensing or exemption pathway. Although NEXTDC's FY26 presentation confirms development approval, public evidence confirming completion of these requirements was not found.

Source: SemiAnalysis Datacenter Industry Model; NEXTDC M4, Port Melbourne, Australia, September 8, 2026.

Figure 2 – Aerial View of Development - Render

Zerra DC Queensland

Several signs pointed to Australia as Anthropic's next push: the hiring signals, Australia's emergence as a major APAC datacenter market, and one unusual source, the Queensland Premier's published ministerial diary.

The May 2026 diary records a meeting between the Premier, Australian Data Centers' CEO and other ADC representatives, a Macquarie Capital executive, and Anthropic's datacenter transactions and leasing lead. That is the exact consortium that signed the Western Downs lease on 16 September.

7 May 2026	Casey Lyons, CEO, LIVIN, Other LIVIN Representatives, Ministerial Staff	Portfolio Matters
7 May 2026	Mark Pont, CEO, Australian Data Centres, Ivan Varughese, Head of Infrastructure and Energy Capital, Macquarie Capital, Cyrus Aga, Data Centres Transactions and Leasing, Anthropic, Other Australian Data Centres Representatives, Other Anthropic Representatives, Ministerial Staff	Portfolio Matters
7 May 2026	D-G, DPC, Public Sector Commissioner, Departmental Staff, Ministerial Staff	Portfolio Matters
7 May 2026	D-G, DPC; D-G, Department of the	Portfolio Matters

Source: SemiAnalysis Datacenter Industry Model

Anthropic's first Australian datacenter deal, signed on 16 September, is a lease for the first building of a planned four-hall campus called Western Downs Digital Park, on farmland about 250 km west of Brisbane in the state of Queensland. The developer is Zerra DC, a Singapore-backed group, working in a consortium with Australian Data Centers, a small Canberra operator majority owned by the listed property group Dexus, and Macquarie Capital as both investor and adviser.

The lease was confirmed on the floor of the Queensland Parliament, where the Premier told the House on 16 September that 'Anthropic signed an historic agreement for their first Australian data center' at the Western Downs Digital Park, with the site 'planned to come online in 2027'.

We model the Zerra DC site as a planned four-hall campus, with a 1,440 MW of IT load, 360 MW per hall. Our start of operations sits in 1Q28 for the first hall, with full build-out by 1Q31 and Anthropic as a tenant on the first building only. However, the campus is running behind on the permitting side right now, as the council application has not opened for public notification, and there's no grid connection agreement with Powerlink, which is the state-owned company that owns and operates Queensland's high-voltage transmission network.

Source: SemiAnalysis Datacenter Industry Model

Speaking of power, the campus is designed to connect at 275 kV and 330 kV to Braemar, a substation of Powerlink, the state-owned transmission utility for Queensland, about 600 meters from the site, with roughly 1.6 GW of gas generation immediately adjoining it across the Braemar 1, Braemar 2 and Darling Downs power stations. Backup generation for this site stands at just five 2.2 MW diesel units per hall, 44 MW across the campus, sized for network rooms and life safety only. The filing puts total facility demand at 2,160 MVA at full build, 540 MVA per hall at a stated PUE of 1.5.

Source: SemiAnalysis Datacenter Industry Model; Zerra DC, Queensland, Australia, September 3, 2026.

India

Colocation providers and developers

Digital Edge Navi Mumbai

Digital Edge’s Navi Mumbai campus is a multi-building hyperscale development in the Thane Belapur industrial corridor. The facility is modeled as a ~315 MW campus across three rows: a 65 MW row, of which 15 MW is already live and 50 MW is under construction with deliveries from mid-2027, a 100 MW planned row due in late 2027, and a 150 MW planned row from 2028.

We attribute the campus to AWS, with Anthropic as end user on the 65 MW and 100 MW rows. ICRA, which is the credit rating agency covering the operating company, confirms that BOM1 and BOM2 (about 66 MW IT together) are fully pre-leased to a single unnamed hyperscaler on a 17-year tenor.

Lumina CloudInfra Airoli

The Lumina CloudInfra campus at Airoli, Navi Mumbai, is a two-building site on a leased MIDC plot that we model as 60 MW IT across two rows: a 30 MW building operating since January 2025, and a 30 MW second building under construction since January 2026 with delivery in June 2027.

Lumina was acquired by AirTrunk on 20 April 2026, and the Airoli campus is now marketed as AirTrunk BOM1 at “62+ MW”. Power is drawn through an on-site 220 kV substation with two 220/11 kV transformers of 100 MVA each shown on the approved layout, backed by 56 generators of 2.5 MVA, with the state distribution utility as supplier.

ST Telemedia GDC Navi Mumbai DC2 and DC3

ST Telemedia GDC’s Navi Mumbai DC2 and DC3 are two buildings under construction on the operator’s MIDC campus at Khairane, next to the operating DC1. We model them as two rows of 40 MW IT each, both with a July 2025 start of construction, and deliveries in October 2026 and February 2027.

Groundbreaking was in November 2024. Infrastructure works and steel were visible in April 2025, the first level in October 2025, and the May 31, 2026 imagery showed the imaged building close to topping out; the operator still listed both as under development in mid-September 2026.

CtrlS Navi Mumbai

CtrlS's Navi Mumbai campus at Mahape spans the operating legacy buildings and a new three-tower plot; we carry 35 MW per building on the pipeline rows, with deliveries in mid-2026, April 2027 and 2028. Building 2 was under construction by February 2025.

However, CtrlS is looking to ramp up the campus's IT capacity, as the July 2026 expansion clearance raises the new plot to three towers of G+12 at 618 MW connected load. Supply for the new towers is planned through an on-site 220 kV gas-insulated switchyard with a bay for the state transmission utility, backed by 348 generators of 2.5 MVA. We model about 70 MW of Anthropic-linked capacity for this campus, but the figure could very well

increase, given CtrlS's newest expansion ambitions.

Sify Rabale Towers 6 and 7

Sify's Rabale campus in Navi Mumbai is a multi-tower colocation site on MIDC land, and Towers 6 and 7 are the pair now under construction. We carry Tower 6 at 37 MW IT, 5 MW of it already live and the remaining 32 MW under construction since June 2024, delivering in August 2026 and ramping to full load by March 2027, and Tower 7 at 40 MW with the same start and delivery in October 2026, ramping through June 2027.

We attribute both towers to AWS with Anthropic as end user, about 77 MW of Anthropic-linked capacity landing between late 2026 and mid-2027. Publicly, Sify's April 2026 filing reports a global hyperscaler contracting "their largest single-building liquid cooled capacity in the Indian subcontinent" and 81 MW contracted for delivery in FY2027.

Hyperscaler builds

AWS Meerkhanpet 2

We estimate Amazon’s five-building Meerkhanpet expansion at approximately 231MW of IT capacity, with initial operations in Q3 2028. Our opening estimate follows the government’s 24-month target announced in July 2026.

Environmental clearance was granted in March 2026, followed by Consent for Establishment in April. L&T’s September 2026 recruitment for HYD123/124 piling and foundation roles points to construction preparation, but our latest satellite checks showed no visible construction activity.

The 151 acre development sits alongside AWS’s existing HYD-121 campus, as expansion adds to AWS’s Hyderabad footprint, where it launched its second Indian region in November 2022 with three Availability Zones. Our full campus IT capacity estimate assumes a 1.5 PUE against the 346MW planned electrical demand.

AWS Chandenvalle 2

We model this site as a three-hall campus totaling 270 MW (100, 100 and 70 MW). The site is an Amazon self-build located on a 97 acre parcel in Hyderabad, and as of now, we haven't seen vertical construction activity. Amazon's amendment filing claims that the project has entered a delay due to "refined design considerations", but they haven't mentioned possible breakthrough timelines. Amazon does hold a consent for construction, so we are expecting vertical work to begin once the pending design amendment is granted.

Source: SemiAnalysis Datacenter Industry Model; AWS Chandenvalle 2, India, August 10, 2026.

AWS Palava

The Palava site saw its EC granted on August 26, and we model this campus as a four-hall 473 MW IT facility with deliveries from 2028 to 2029. The site hasn’t seen any construction activity yet, and we attribute it to the permit sequence: the clearance is only three weeks old, and the pollution-board consent to establish, which must precede any construction, has not yet been issued.

Grid supply will come from a new 400/220 kV gas-insulated substation at Ambernath that the Maharashtra regulator approved on 1 June 2026. The campus itself carries a 220 kV GIS building and 500 MW of connected load under clearance, with MSEDCL as the distribution utility.

Europe

Norway

Bitdeer Tydal

Bitdeer's Tydal conversion in Norway will deliver 121MW of IT capacity to Volta, with Anthropic as the suspected end user, and we expect the leased capacity to ramp from Q1 through Q2 2027. Management has consolidated the original two-phase schedule into a single data hall complex, eliminating the earlier Phase 1 activation and targeting the full 121MW for March 31, 2027. We view that timetable as aggressive and model completion one quarter later. The separate, self-operated AI Cloud phase is expected to start in Q4 2027 and ramp into 2028.

Source: SemiAnalysis Datacenter Industry Model; Bitdeer, Tydal, Norway, September 1, 2026.

The site has 180MW of gross power under its NVE concession, comprising 100MW firm and 80MW curtailable. Of this, approximately 133MW supports Volta's 121MW IT lease, while 47MW is retained for Bitdeer's own AI Cloud. The site sits beside Statkraft's 175MW Nea hydro plant.
